WIDE came first. Then there was TRACE. Now there's WIDEn-n and TRACEn-n.
:)
This is best answered in the APRSdos README text files. Scroll down to
DIGIPEATERS at:
http://www.dididahdahdidit.com/dosaprs.htm

Or get APRSdos846 (runs fine on Windows98SE too) at:
http://www.tapr.org/tapr/html/Faprssig.html

APRSers,

Pictures of the new HamHUD printed circuit boards are up:

http://www.c2-tech.com/~steveb/hamhud/index.html

We are currently sold out (48 boards snapped up in just a couple days),
but another run is already being started! Thanks to the many who have
started building a HamHUD.

73,

Steve Bragg KA9MVA

Um. I did for a while - so I could have the TNC set to 9k6 for talking to my
palmtop and then switch over to GPS mode. The palmtop software didnt like
4k8?

132. [htaprs] Resets from TM-D700 in APRS-Mode

From: "Thomas Lindner" <DL2RUM@csi.com>
Date: Sat, 20 May 2000 9:2:10
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-84984-2000.05.20-09.04.16--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With TNC in APRS Mode:

When tuned the radio to a local digipeater,
I'm not able to monitor binary packets. The TNC will reset every minute, or
shut down the radio. During "normal" ASCII traffic, or APRS datas on the
digi is all okay.

Can somebody confirm or duplicate this failure, or is my radio faulty?

Any ideas?

Greetings from Hamburg de Tom, DL2RUM

I submitted some information to Bob, WB4APR about a month ago which told
of a situation that I experienced (with ASCII data) that caused a D700
mobile to change modes or shut off as well. I believe it was forwarded

to Kenwood, however I don't think they've responded yet.

It would appear, that based on your experience and mine, that possibly
some or all D700 may have a problem in this regard.

I have two 700's (truck & Jeep) and my son also has a 700. I can send him msg's from either 700 and he receives them okay. If I send him a msg from my base station (using a Kantronics 3 Plus), he never receives them, yet I receive his. And yes, I can send msg's to both of my vehicles from my base station with no problem. I'm confused and would appreciate any comments. 73, "J".

Cannot seem to figure out how to hook up my TH-D7 with my Casio E-100 running APRS-ce.

Right now I have my Garmin 12xl gps hooked into the TH-D7 gps port and it works. I get a position in the radio.

Trouble comes when I try to connect the TH-D7 and access the tnc. I made two cables one for RX(2.5mm) and one for TX(3.5mm) like the TH-D7 manual says. I have tried connecting rx to pin 2 going into a null modem adapter and to pin3 no luck. I have also tried tx to pins 2 and 3. No matter what the combination APRS ce will not open the port for the tnc. Also some funny things happen like the radio freezing on transmit or receive.

I have the tnc aprs-ce settings at com1, tn2, and 4800 baud.

I need some suggestions on how I can go about getting this to work.

Hi Myrt

My first understanding is that you are trying to use audio
for transmit and receive from the Casio?

The Casio is used as a computer and is plugged into the PC
connection of the D7A, not audio tx and rx..

To use the TNC then as a Packet tnc and running WinCE, the
D7A must show TNC Packet on the LCD. It runs at 9600,N,8,1
as the manual suggests. Does this help? Or am I
misunderstanding your problem Myrt?

Good luck es 73,

Robbie WA9INF

Myrt,

I am able to use AprsCe and E-100 with a PacComm Pico Packet and
a null modem adapter.

You might try shutting down all other applications on the E-100 before
attempting to use AprsCE. I have had problems with other applications
seizing the single serial port.

I connected the null modem adapter to a serial port on my desktop
machine for testing purposes. Make sure you do not have ActiveSync
running when you do this. If AprsCE data appears in your desktop
terminal program window, then it is likely that you have a D7 cabling
problem.

Not sure I understand your serial port settings. 4800 tn2?

HTH,
Bill KC9XG

140. [htaprs] New! Satellite Digital Messaging

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 22 May 2000 01:17:48 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-85247-2000.05.22-00.20.32--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This weekend, coincident with the Dayton Hamvention 2000, ushered in a new
milestone in personal wireless world wide amateur satellite message
communications. Following several months of on-air testing, and the
convergence of several new announcements, mobile-to-mobile and handheld
amateur satellite message communications are now a reality!

At Dayton, Kenwood revealed the 9600 baud upgrade to their existing
1200 baud APRS handheld, Alinco revealed their new 1200/9600 baud data
radio, and the South African SUNSAT team announced the availability of
their satellite for APRS type UI messaging when not in use for scheduled
voice passes.

Using the built in 9600 baud TNC's in the Kenwood and ALinco data radios
and the effecient APRS messaging protocol, it is possbile for simple
mobile or even handheld stations with simple antennas to communicate
briefly via SUNSAT or any satellite that is enabled for UI digipeating.

ALthough the recent growth in FM voice satelites has sparked
excitement throughout a new generation of satellite enthusiasts,
the short, single channel voice operations are highly competitive
and difficult to share equitably among a large number of users.

But with one-line APRS messaging, each packet taking less than a second,
there is potential for far more stations to share the satellite during
each pass while also getting short but meaningful communications through
the bird.

In addition, being in digital form, any station receiving these packets
can link them into the worldwide APRServe internet system for
real-time delivery back to terrestrial RF anywhere on the planet.

The following example says it all. During the Dayton Hamvention Sunday
morning SUNSAT pass, I was trying to demo 9600 baud handheld reception
in the fleamarket area using nothing but my HT and whip antenna. Hearing
nothing but 60-over S9 interemod, I gave up and put the HT in my pants
pocket and continued my shopping. A few minutes later I heard the
tale-tale beep from my HT indicating a new message.

Thinking it was just another message from my buddies at the
hamfest, I casually pulled it from my pocket and was surprised

to see that it was a BULLETIN from SUNSAT! It was one of the handful
of Bulletins that SUNSAT downlinks and it was announcing that this
capability was now open for general use. There could not have been
a better and more fulfilling conclusion to our previous testing than this
serendipitous reception.

Thus, an Amateur Satellite Message was delivered to a non-optimized
in-attentive handheld user using EXISTING amateur radio equipment. What
makes this possible is the 6 dB stronger downlink transmitter and 9 dB
better 2 meter path loss compared to the other 9600 baud UHF downlink
PACSATS.

Although it might appear that the return path on UHF from the HT
back to the satellite would be impossilbe due to the additional 9 dB
path loss, the presumption is that an HT user with an outgoing
message would be aware of the pass and would use a handheld
beam to make up for the difference. Thus, we have worldwide amateur
satellite HT message capability anywhere. (Note, due to the real
time digipeating of these messages, there must be groundstation
somewhere within the same satellite footprint, about 2000 miles
to send/capture these packets.)

But even without beams on the uplink OR downlink, we can still do two-way
messaging to handhelds.... Here's how...

Some other non-published testing via a 9600 baud satellite has
taken advantage of the 9dB 2 meter uplink advantage and has demonstrated
reliable UPLINK of packets from HT's with omni whip antennas and
non-tracking, un-attentive style message delivery. THus, if one of the
existing mode J PACSATS were enabled for UI APRS style messaging, then the
combined two bird constellation of SUNSAT making message delivery and the
PACSAT relaying return traffic, gives us a worldwide two way shirt-pocket
amateur satellite messaging capability!

The real excitement is that we are doing this now, today. It requires
NO new satellites and NO software mods to the existing birds. Two way
messaging is possible HT-to-HT and mobile-to-mobile. Further enhancements
linking this in to the terrestrial APRS worldwide internet linked
infrastructure that then gives global real-time delievery is simply a
matter of adding simple omni antenna receivers at a few of the existing
APRS IGates and a little software.

For details of this exciting new mobile satellite capability and the
years of UI digipeating testing leading up to it, see:

http://web.usna.navy.mil/~bruninga/astars.html

We expect this site to change rapidly as more experimentation is conducted
on this mode of communications. SO check back in a week or so when we
condense all this new info...

We hope this realtime-messaging capability will provide a new lifeline
for amateur stations on-the-go, in the wilderness, at sea and anywhere
else that is beyond the reach of terrestrial amateur communications.

de WB4APR, Bob Bruninga

Satellite Ground Station, US Naval Academy, Annapolis, MD

Hi

I have just read a posting on this group about a 9600 upgrade to the D7's HT's could some one please
tell me more as I was not at Daytona. Also did any one see if Kenwood launched a mobile HF+2m+70cm and
6m combo rig. Any info on that one too would go down a treat.

Many thanks

Hello

Anyone know when or where the programming software
for the new D7A firmware will be available?

Thanx

I should have been more specific.

I had the new firmware burnt into my D7A at Dayton. I am looking for the new
mcp_d7 programming software. The old one doesn't work anymore.

Also the new firmware is available from Kenwood for around 60 bux. You have
to send your rig to them for this upgrade.

Flip (or someone else)

Could you give us some details on the new firmware?

What's the advantage to doing it (besides 9600 baud aprs)?

Chris

Well it is quite extensive. It in the words of the Kenwood rep
it's the same features of the D700 firmware. The comparison sheet I received
front and back full of changes.

>From the little time I've had after returning, it seems the same,
as the 700, but I'm pretty well pooped after working for a dealer over there
since Wednesday.

If you are not familiar with the D700 firmware maybe I can
scan this sheet in and send it to you direct.

Hi Peter,

First, the TH-D7A has a significant upgrade available for it. It is the
TH-D7A(G). The upgrade will be regularly available after June 1st from what
I have been told. The cost will be $60.00 US.

The upgrade does several things including:

* Fixes the TNC crashes from lots of activity and packet data
* Allows cross band TNC operation
* Allows multiple status messages
* Position ambiguity
* Altitude transmission and reception
* APRS at 9600 baud
* And much more

Basically, it brings the TH-D7A up to the functionality of the TM-D700A with
the exception of being able to use it as a digipeater or cross band
repeater.

Secondly, as for new radios. Yes, Kenwood unveiled a new radio they are
currently developing. It will operate HF,6 meters, 2 meters,70 cm and 1296.
All mode, satellite capable, etc. It will have a built in TNC. It is
really slick. It is still in development and is not yet available. They
don't even have a model number on it yet.

That's it for now.

73,

Jon

I think my favorite feature of this upgrade is the fact that when you
receive a new APRS packet and the screen displays the info, you can
IMMEDIATELY transmit and talk on the other band just by pressing the PTT
button. You DO NOT have to push it twice as you used to have to do.

I asked the Kenwood reps about this upgrade. It was so new that the D7's being sold at the Hamvention had the old firmware in them. You had to take the unit to the Kenwood testing booth to have it flashed. The firmware release will be available for the rest of us around June 1st. The Kenwood rep suggested that I subscribe to the Kenwood e-mail SIG at their site to learn when it will be available. He also hinted that, if I was a member of TAPR or join TAPR the upgrade price would be discounted.

Does anyone know if this includes a 'beep on mine' feature?

Will existing software work with it, or does it require an upgrade to the Kenwood control software?

Anyone have a Idea about the cost (free) for D7 owners who never upgraded
from the original software? I never could bring myself to send it back
because I would miss the radio too much. But this new software and my D700
might allow be to live with out the D7 for a few days. Also I want to be
ready for the new, all band, all mode TS-7000 radio that is in Bata right
now.

 PS, I just made that model number up!

So typical of my luck. I bought a 2nd D7 3 weeks ago.   Now I get to send
two out for update.   I guess my $375 D7 (bought on RT Systems closeout)
isn't so cheap now :-(

I just saw the feature list though and it looks well worth it. I suppose
I'll send one at a time off to Kenwood.

For sharing SO35 with Voice users, I think they only plan on ONE orbit per
day for VOice You can usually assume that it is the EVENING pass and only
the one that goes smack over the center of the USA. GIven that operating
scenario, and where you live you can guess which passes will be voice and
which will be data in most cases. ALso, John Lochner sends the following:

---------- Forwarded message ----------
From: Johann Lochner <lochner@ing.sun.ac.za>
To: SO-35 UIB/APRS <lochner@ing.sun.ac.za>
Subject: Sunsat Newsflash 20000522

NEWSFLASH: DIGIPEATING IS TEMPORARILY DISABLED UNTIL AT LEAST 07:15
UTC ON TUESDAY 23 MAY, WHILE IMAGER EXPERIMENTS ARE PERFORMED.

Thanks for all the interest in the new services announced on Friday.
Just a quick update of the current state of affairs: we hope to keep
Sunsat in Mode BD continuously and schedule Mode BA once per day per
continent as before. This should also make Sunsat's digital services
more accessible to hams in South Africa. Note that these services
may be disabled while other non-ham payloads are activated.

The Sunsat Ham Page <http://sunsat.ee.sun.ac.za/ham1.htm> was updated
somewhat. Please visit there first, before dismantling your stations
if Sunsat seems not to follow schedules. We always play around with
stuff and often break things: no better way for learning :-)

Regards,
Johann, ZR1CBC

Now, if they would only come up with a firmware fix for that for the
D700 - that is my main 'bitch' about the D700 - otherwise I love it.

What's wrong with the D700's firmware? I bought one of the first ones
available and have had absolutely ZERO problems with it. It has worked
flawlessly.

 What is wrong is what was said below. The D700 still locks you out
like the old D7 firmware when an APRS posit is on screen. You have to
hit a button to get control back to say talk on the other band .. Many
a time I thought I had transmitted to a buddy while in conversation to
find I had said nothing because it never keyed since my PTT only
retruned it from an APRS posit display.

>Does anyone know if this includes a 'beep on mine' feature?

Yes it does and you can turn it off if you like. It also says
"My Position" when it recieves its position from a digi.
According to the blurb it does the smae for your status
posit comment. I'll try to scan the blurb and post it tonight.
>
>Will existing software work with it, or does it require an upgrade to the
>Kenwood control software?

No it will not I beta tested the new firmware with the control
program and no joy. The results of the testing were provided
to Kenwood. They told me that the chips were so new that they
had not seen them before Dayton.

BTW to nip it in the bud it is NOT A FLASH UPGRADEthey have
to take the radio apart and change parts. Not suprising that they
will charge for the upgrade. At least they are providing an upgrade
remember how many times manufacturers have told you to buy the
new model the old one can't be upgraded.

Rendered body type: text/plain

Was wondering if anyone could answer this about the upgrade. As of now, my D-7A states, "My Packet" anytime it sees me after transmitting a packet. My call SSID for the D-7A is a -7. My home is setup to transmit my call with no SSID. However, every time my home TNC transmits, it still shows as "My Packet" when heard.

The problem is that my GPS display (Garmin 3+) is updated every time a new packet is received and I am never able to see my home on the screen, because the radio apparently does not pass along that packet due to it thinking it is seeing itself.

Any ideas if this was considered in the upgrade or not. Thanks de KF4PYA, Travis.

KISS does NOT work in the A model, but DOES work in the new G model.

We ran KISS on the D-700 all weekend at Dayton and no problems, the
D7 is now the same as the D-700..

Not to disagree with you Gerald but here is what I observed when Kenwood
flashed the G program revision into my D7A at Dayton -
  A tech wearing a fluffy white cotton glove on his left hand (kinda
reminded me of Michael Jackson) opened up the shiny metal box inside my
plastic radio case and soldered about 5 wires to the main circuit board..
these wires were connected to a programmer that looked similar to what an
old EPROM programmer looks like.. the tech pushed a button on the programmer
and began to chat with me while the G rev was loaded into my D7A.. Then he
disconnected the wires from the programmer and closed the case very
carefully.
  The soldering iron was used only to attach about five wires onto the main
radio board. Your right the upgrade does take their time but no replacement
parts.
  By the way..the best price I found on a D7A at Dayton was $360+$5shipping
(no sales tax) with a mail-in certificate from Kenwood for a free flash
upgrade, a Kenwood certificate for a free extra battery when mailed in with
your registration card, and a mount to hold the D7A in the car. The tech
indicated that the cost of a D7A to dealers would have to increase very soon
probably causing the street price of the D7A to jump up but they will leave
the suggested retail price alone (for now).
  Great little radio but I wish it had a more durable case.

I stand corrected I only stayed for the disassembly part of the
upgrade then I had to get outside to do my satellite demos.
But as you point out it is a significantly labor intensive process
thus will cost.

The term flash upgrade, and that seems to be what it is, somehow
implies simplicity and this process is not simple. I just didn't want
people to get the idea that they poked a cable into the PC post on the
THD7 and a minute later it was done. In fact a plug in chip would be
easier than what they actually do.

Thanks for the info on the part of the process I did not see.

If there is an interest I have scanned the front and back of the
"Differences" sheet and have a couple of jpeg files I could
provide. I am hesitant to post them since they are large and
not ASCII.

Rendered body type: text/plain

Can someone think of a way to alert interested APRS users walking around Hamvention next year of special APRS equipment deals we stumble upon... we would all have to use some kind of a small portable device capable of displaying text messages received by radio.. maybe we could carry a simple small portable- something like a D7A to receive, decode and display APRS text messages amongst ourselves using a group alias name like "deal". I think that would be better than the teams of hams that search the flea market for the best deals on what they want using voice radios.

Lots of inquiries asking where I found the D7A at Dayton for $360.95+$5 shipping.. It was Ham Radio Outlet, Inc.(HRO) on Sunday. Others may have received even better deals on the D7A at Dayton but that was the best I found. Not sure if you can get the same deal beyond Dayton but give them a call and work it knowing what they were recently offered at.

At the APRS eyeball meeting on Sat evening I learned about the $199 deal for the VC-H1 color camera visual communicator from a Kenwood dealer who was setup out in the flea market parking lot. I don't think they came back on Sunday..at least I never found them.

I see on page 122 of the June issue of QST that RadioWorld is running a final closeout on the Kenwood VC-H1 for $249. Did anyone who attended Dayton hear if Kenwood has a replacement VC in the works? Any rumors?

The dealer was there on Sunday morning. I bought a second one! I'm not sure if I'm going to use them both, but thought it was a good idea to have a pair.

It would be nice. Unfortunately, the D7A's TNC devours batteries. I rarely
turned the TNC portion on all weekend.

>

They were the best deal this year. But they sold out on Sunday. The next
best and most common price seemed to be $379. And we thought that the $450
or whatever we paid last year was good! Oh well!
>

Too bad. They were there. They are RadioWorld and they advertise in QST.
Call them and see if you can still get one. They were real near that big
crank-up tower on the trailer.

Interesting story about these guys:

Radiworld is a Kenwood Canada dealer. Kenwood Canada has decided to no
longer sell the VC-H1 so they sold about 500 units to RadioWorld on closeout
for a blowout price. That's why RadioWorld has been able to sell them so
cheap. In fact, Kenwood told me that $199 is below US dealer cost!

Anyhow, these cheap prices have torqued off Kenwood USA. It has absolutely
killed sales of the VC-H1 at the US dealers. I think they realized how much
because everyone I met also told me they got their VC-H1 from Radioworld!

I guess in a capitalistic, free market economy this sometimes happens. We
as the consumer won. I understand Kenwood USA's beef and I sympathize but I
can't blame RadioWorld either. How many dealers would be willing to take
the risk of trying to sell 500 units?

Anyhow, it's a neat toy. My only question is this: It has a Kenwood Canada
warranty card. Would this be recognized by Kenwood USA?

Kenwood Canada is not going to sell them anymore and RadioWorld bought
Kenwood Canada's entire inventory. At Dayton they were selling them for
$199 (below US dealer cost). Kenwood USA is STILL going to sell them and
Kenwood is STILL going to manufacture them.

There is no replacement. It's still an active product.

They were indeed there on Sunday. They are a dealer from Canada and I
believe the name of the dealer is Radio World. When I talked to them at
the CQ party on Saturday night, they said they only had about three
VC-H1's left.

There's always the $500 commercial version.
Apparently, for $300, you get a thick rubber bootie.

I'm not a marketing person, so I just don't get it.

SImply key in a Bulletin to all with the name of the item and the booth
number. Then, everyone with a THD7 could go right to the space.

Rather than typing it into the sender's HT, he might just wait till he
gets to the APRS booth and type it in there on a Real PC..n Still, those
with the HT would receive it.

GOod idea.

In a message dated 23/05/2000 03:02:52 GMT Daylight Time, travis@btea.org
writes:

<< Was wondering if anyone could answer this about the upgrade. As of now,
my D-7A states, "My Packet" anytime it sees me after transmitting a packet.
My call SSID for the D-7A is a -7. My home is setup to transmit my call with
no SSID. However, every time my home TNC transmits, it still shows as "My
Packet" when heard.

 The problem is that my GPS display (Garmin 3+) is updated every time a new
packet is received and I am never able to see my home on the screen, because
the radio apparently does not pass along that packet due to it thinking it is
seeing itself.

 Any ideas if this was considered in the upgrade or not. Thanks de KF4PYA,
Travis.
  >>

Strange. My non upgraded TH-D7E does not have the problem you describe. It
displays packets from my home station (G7GUO) correctly and sends the correct
information to my Garmin GPS3. It does of course display packets from the
TH-D7E that are digipeated via my home station as MY PACKET as it should. I

have mycall set to G7GUO-7 in the TH-D7E. Maybe the TH-D7A firmware behaves
differently in this respect?

Well, I HOPE Kenwood listens to this one.

I just found out that their new All Band All Mode Transceiver announced at
Dayton has a BIG, HUGE problem. It can ONLY operate in AM or FM on the sub
band. This makes it worthless for Satellite or SSB work.

Sad they are so short sighted.

Rendered body type: text/plain

Emergency Messages & Travelers:

With the advent of APRS single-packet emergency communications from
wilderness, at sea, or long-distance-via-satellite isolated users,
we need to have a means of quickly validating emergency alarms
when return path communications may not be possible. Since any
Mic-E, or Kenwood APRS radio can send an emergency message with only
a simple key stroke, we have the potential for occassional false
alarms.

  WHile such alarms cannot be totally eliminated, we could establish
a formal "APRS travelers registry" process where wilderness or
off shore travleres embarking on an adventure could file a travel
plan in advance. THis site would then serve as a single point of
reference for access by APRS operators when an Alarm is detected.

If the Emergency Callsign matches a message in the "APRS travelers
Registry and makes sense with his posted itenerary, then better
credence can be given to his single-packet emergency request.
In addition, with the advent of now up to six CUSTOM messages
in the Mic-E/Kenwood formats, the traveler could even indicate
his personal equivalents for these custom coded bits, and thus
indicate up to 6 different potential emergency needs.

For now, such a registry could be initiated by simply posting an
Email to the APRSSIG with the subject of "MY_CALL TRAVEL PLAN".
These can be just saved away into a folder in case of future
need. If an Alarm comes in, a simple scan of the folder would
reveal any travel plans saved under that callsign. Not only does
posting to the SIG serve to register the plan, but it also
alerts all APRS operators of your trip who might want to
follow along on your travels by radio. Of course, if this idea
really does make sense, then a separate list on the TAPR
LISTSERVER could be used. There could be both a public and a
private list. Normal archiving and search processes
could be used to access the data.

Just an idea...   Remember, if we dont use APRS in the real world,
then its just a toy...

Rendered body type: text/plain

This could set a very unsatisfactory process in which there could become
established a graded response to 'emergencies', and it is for this reason
that 911 response is never downgraded based upon a past history of false
alarms.

Is there to be a faster emergency response to someone who has filed a
'flight plan' before leaving? Is someone, having filed such a flight plan,
less likely to send a false distress message? Is someone in distress who
hasn't filed a plan going to be left until a second, third, fourth or more
packets are received?

Like any distress system, there will be false alarms and malicious calls,
but those of us in law enforcement, search & rescue EMS, and related
disciplines have to tolerate these, and still provide the necessary response
to all calls for help. We still get boaters who fire distress flares 'to
test them', or false, malicious or accidental 911 calls "I meant to dial
411!"

A single packet may be the result of failing power, remote location, or the
operator's action before loss of consciousness.

For those users happy to solicit the interest of other APRS's to their
sojourning, that's fine, and it's a great idea for that purpose, but we
should not be considering any grading of response to a call for help. It
could also be used for listing balloon launches and arctic circle trips and
other journeys of scientific or technical interest, but not for validation
of emergency calls.

185. [htaprs] Re: [aprssig] RE: APRS Travelers Registry

From: "Rich" <n0rul@kscable.com>
Date: Tue, 23 May 2000 22:59:50 -0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-85734-2000.05.23-22.58.33--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Our area 911 dispatchers must evaluate each incoming call giving it a
priority and call type before limited resources get assigned to it. I think
that registry information would "upgrade the initial response level" given
to reported APRS alarms.

Imagine a female ham is 8 months pregnant driving from home to her OBGYN
doctor 30 miles away in a rental car - the registry could be informed of her
relevant medical condition together with the make, model, color, and tag
number of the rental car along with a contact phone number for her non-ham
husband. A well intentioned APRS user 500 miles away trying to report her
alarm could save themselves several minutes waiting upon the telephone
operator to connect his reporting phone call if you would just allow her to
list (in the registry under her callsign) the area code and seven digit
direct dial phone number for her local 911 center (because you can't dial an
area code followed by 911). Rather than sending just an officer to "check
on the welfare" of a ham- the Dispatcher might instead be more inclined to
also send EMS to her initially if her situation has been detailed via an
email to the APRS travelers registry.

Does a 911 hangup phone call get an ambulance right away ? No, neither
should an "unknown call" based upon an APRS alarm without any supporting
info.

I think the concept of an APRS Alarm Registry makes sense.

Hi guys,

Here is the response I got back from Kenwood on the new radio. They say it
will do split all mode operation.

>From what I can tell the sub-RX is basically an FM dual bander stuck in
there as well. Interesting stuff.

Thought y'all would like to know this.

Agreed. Actually, my idea was not to degrade emergency response as some
have inferred, but instead to allow travelers who were at higher risk to
be able to post important details about there trip that could be used as a
resource if they were in trouble.

Kenwood doesn't know their own rigs very well. The TS-790A definitely has
two receivers. At least mine does!
...and so does every other one I've ever seen!

Ed,

Personally, I feel okay about the price. If they had been smart on the
outset, and made their radios user-upgradeable, then I'm sure there
wouldn't be any cost for the upgrade (the Garmin support model).

Given that the design did not account for user upgradeability, I think
this is a pretty good alternative.

I am willing to pay $40 for the PTT/APRS bug fix alone. The addition of a
KISS mode and 9600 baud satellite data ops (VERY impressive in a HT)
easily make up the difference.

The price I paid ($420 a while ago) + $60 is still cheaper than the
closest competitors (none).

The only thing left on my wish list is a heat-sink/fan/powersupply that
attaches in place of the battery for mobile applications. Darn power
connector is next to useless in a permanent install, and the back of the
thing heats up like the dickens when running for extended durations on
external DC.   You have to attach a battery to use the keypad, otherwise
you burn your fingers.

I've got a design for the heatsink/fan/powersupply in my head.. I just
can't figure out how to make a heatsink using my available materials (duct
tape, bailing wire, zipties) and my available skills (applying duct tape,
tieing bailing wire and fastening zipties)

I can't squeeze a D700 in my Miata, so it's D7A(G) or nothing. (How long
will we have to put () around the G?)

I've got a feeling that the reason why the radios are not user upgradeable
is due to FCC certification issues. It could be that having a user
upgradeable radio would be something the FCC doesn't like. Most of the
operations are all done in software so being able to change it at the user
level could allow you to receive in areas that you aren't supposed to (like
cellular maybe - not an issue with the D7, but is with the D700). It's just
a guess but I bet that's why. It also could make the unit more complex and
more expensive.

Who knows. But the radio worked great before the upgrade regardless of the
bugs. Now it works even better.

Brian,

Yes the Kenwood upgrade is much better than the Icom upgrade (or any one else's radio for that matter) buy a new radio every 1.5 years to get the features you didn't know you needed before you bought the last new radio!

So why do I want my less than a $1,000 dollar radio to last for 12 years but buy a computer for $1,800 dollars knowing full well I will have to get rid of it in less than 3 years?

Well, this is obviously not an insurmountable issue: the Garmin GPS units that
I referred to are also FCC type-accepted.

> It also could make the unit more complex and more expensive.

Well, when a $99 GPS has the feature, the "cost" argument starts to seem less like reality and more like spin. Nevertheless, Kenwood is doing right by me in that they are "supporting" their product.

>I'm ready to sent my D7 out for an upgrade. Does anyone know when the
>upgrades will be available, and who to contact for the upgrade?
>

I received this reply from Kenwood this morning:

Dear Kenwood Customer:

Thank you for your e-mail. The TH-D7A (G) upgrade will be available in
6/2000
The cost is about $60.00 plus shipping back to you. Both Kenwood Service
Centers will perform the upgrade. Do not send your TH-D7A until you contact
us first for its availability.

SHIPPING INSTRUCTIONS

Kenwood Service Center West
13030 Alondra Blvd., #104
Cerritos, CA 90703-2257
562-483-8740 phone
562-483-8749 fax

201. [htaprs] TH-D7 (G) Upgrade Docs on Kenwood Website

From: "Brian B. Riley, KA2BQE" <brianbr@macconnect.com>
Date: Wed, 24 May 2000 17:21:26 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Message-ID: <LYR845-85912-2000.05.24-16.23.28--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just checked Kenwood's website and while they have no announcement
about the upgrade they do have the manual on the download area:

 Now Kenwood made a goof .. This first one should be the English
language manual, but it is the Spanish language manual;

  <
http://216.98.255.24/Amateur/Instruction%20Manuals/THD7A(G)_NEW.pdf>

  ... sooo I went to the Spanish language folder and the Spanish
language folder has a file labeled with the Spanish language prefix
"ES_" but it is really the English language manual.

<http://216.98.255.24/Amateur/Instruction%20Manuals/Spanish_Manuals/ES
_TH-D7A(G)_NEW.pdf>

  ... either way, if they correct it by the time you get there ... you
can tel them apart ... the English version is 426KB and the Spanish is
429KB

The TECHNICAL reason the D7 is NOT field upgrade-able is that you
have to SOLDER three wires to the main board to do the upgrade..

Fortunately, it only takes them less than 15 minutes to do the entire
thing. I stood there and watched them do it..

I also feel there is some lawyer's opinions in there too...

   INVALID argument! GPS's do not transmit!!!!! FCC only cares aboput spurious emissions which won't be all that strong from a GPS. a 5 watt transceiver is a whole different ball of wax!

> > It also could make the unit more complex and more expensive.

   INVALID argument! THD7 is already flash programmable, its just not easily done. Intentionally so. You have to open it up and solder some wires on. FCC doesn't want it being done by any old yahoo through the serial port. The D700 is also and it is done by the serial port, but you have to open it up anyway and reover or set a jumper first.

I've only got a few seconds here before I must leave, but...

Check out http://www.tapr.org/~aprsce/ or just go directly to ftp://ftp.tapr.org/aprssig/wince/ .

I've just uploaded v0.99 Build 691 of APRS/CE. If anyone has problems getting this to install, please let me know. This version expires on 31-July-2000.

Thanks for your patience... it's been a crazy week at work and it's only Wednesday...

Whoa! The manual states that there is now an "ignore DCD" function!
Cool... now sunsat up/down is possible without a QSY on the downlink.

Whoa! Bring down the db level.. my hearing aint so good no more. If you
are saying that GPS's aren't the same because their RF operation is not
affected by firmware upgrades, I'd agree. But I don't agree that you
can't make a D7A that is user upgradeable without the modifiable RF
operation. Frankly, I think its a trivial implementation.

And, anyway, my VX5R can be converted to Freeband in software! So the
FCC sure didn't seem to care in that case.

They dont TRANSMIT.

> > It also could make the unit more complex and more expensive.
>

But you can manufacture 1,000,000 of the $99 product, but only have a
market of say one half of 1% of that for the HAM radio...

<grin> Ham radio is still a "small market" and you just cannot get
economies of scale as you can get in counsumer products...

Saying it again: the VX-5R is freeband modifiable in software. The FCC apparently
doesn't care, so long as cell phone reception is not possible.

The FT-51R had a 12 volt adaptor like that. It was a good idea and it
worked well. High production costs phased out the fan in later models. I
bought an early one and it had the fan.

Yes, a Mic-E position report. The TQPX2V is the LATITUDE and message bits
and show a latitude of 41 08.26 North. The message bits indicate
"off duty"
The 27 indicates a Mic-E.
The 6D 3B 6B is longitude of 82 31.80 W
The 6C 20 1c is CSE/SPD (im too lazy to decode)
The 6A 2F   is the ICON for a Jeep
The 5D   indicates it is a Kenwood D700
The 22 37 3b 7D is the altitude which I am also too lazy to work up...

(I may have made some hand decoding mistakes here, but you get the idea)

Bob

It's so true. Hams cringe at spending $2000 for a good radio, but EASILY
would spend that on a computer.

The average ham's computer budget is FAR larger than their radio budget.
When I bought my last computer, the total bill was around $3600. Not even
my FT-1000D cost that much.

Amazing but true.

Brian,

You don't get it. Modifying RECEIVERS is not what the FCC is worried about.
The TH-D7A modification affects it's TRANSMITTING ability.

Any thoughts to using the little 12 volt CPU fans in a
empty battery holder with the appropriate ventilation
holes? I was thinking of doing this for mobile
operation.. :-)

Robbie

Just unpacked my new D700. Got it powered up. Downloaded the D700
programming software from the Kenwood FTP site, installed it. Got it to see
the D700. Load the call sign and some freqs. It works. Now...

1. The Help screen says it is version 0.00. We know that. The same screen,
at the top, in the colored bar says it is MCP-D7. Then in the box it says it
is a D700 Control program.
2. When you go to open a file in the program, you can retrieve *.700 or *.D7
files.
3. Sometimes the file you are looking for disappears from the screen. Got
work on that some more.

So, Can I use the D700 software to "program" the new ROMed D7A(G)?

thanks in advance
Kent

Rendered body type: text/plain

I cannot get gps position data for my APRS-ce.

Here is my setup:

A Garmin 12xl putting NEMA into a TH-D7. I know the radio is getting the
data because when I push the 'pos' button the correct position is displayed.

The radio using a Kenwood PC cable goes through a db-9 null modem adapter
into the factory made serial cable for the Casio E-100.

For the gps setup I have 'gps enabled' and the 'get data from the
TNC(automatic)' selected.

For the tnc I am using 'Com1', 'TN2', '9600' and '8N1'.

APRS-ce will recognize and display other stations and their correct
position. It will transmit the position of itself which is the incorrect
default of W000 N000.

What do I need to change to get this to work?

 ... well Jon, you are both kinda right, the FCC does at least makes a
small show of keeping us from listening on the proscribed frequencies.

Thanks for the decode Bob. I had the longitude decoded but got lost
after that (trying to decode the ASCII characters from the p.mon on
the D700). I completely missed the latitude in the destination
address - I kept wondering all day where it was hid at. Guess its
time to study the protocol reference some more.

Rendered body type: text/plain

We used an eTrex as a tracker from New Orleans to Dayton with no problems other than having to change the batteries once. One thing to watch, though, is the data cable connection at the eTrex. It is prone to sliding off if you're not careful. I should also say that it wasn't my unit, so I'm not really not that familiar with it, but it did lock on the sats MUCH quicker than my Magellin GPS 3000.

I think Service Merchandise has a sale on it through August. Give it a shot.

221. [htaprs] Computer Control of VC-H1

From: Jon Ogden <jono@enteract.com>
Date: Thu, 25 May 2000 00:02:21 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86212-2000.05.25-00.03.20--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

Has anybody been successful with using a computer to control the VC-H1. I didn't buy the software Kenwood sells since I have a Macintosh and I was hoping to be able to send commands manually.

I have hooked up the unit via the com port with the same cable that I use for my TH-D7A. I know it gets something because when the screen is blank and I hit return, it brings up the last received picture.

But no other commands work. I don't know why.

Has anyone else been successful with this and has anyone written any software for the Mac to control the unit and get images from it? I'd really like to be able to do this.

Thanks!

73,

Jon

Myrt,

What INIT file are you using?  (Look in the same place that you set up the
TNC serial port parameters.)

You need to have an INIT file which includes (among other things) the
following lines:

GBAUD 4800
GPSTEXT $GPRMC
LTMH OFF
LTM 10

Here's my INITTHD7.TNC:

* TNC Init file for KENWOOD TH-D7
AWlen 8
BBSMsgs ON
B E 0
LOC E 0
Echo off
FLow off
AUTOLF off
MCOM off
MON ON
MRPt on
PACLen 128
HBAUD 1200
* delete following lines if without GPS
GBAUD 4800
GPSTEXT $GPRMC
LTMH OFF
LTM 10

Just put it somewhere on your CE device and set that to be your init file.
It should start working.

Let me know how it goes...
```

well lets see. I own a ADI 600AT. That HT is KEYBOARD modifiable to
TRANSMIT out of band.
The radio is readily avable almost everywhere. The augment that the FCC is
why the D7is not user upgradeable doesn't hold water.

I am not using APRS-ce but when you set up your Garmin Interface, I thought
the transfer speed was 4800 baud. I know when you set it for NEMA/NEMA you
get 4800/4800. Hope that helps!

Rendered body type: text/plain

I have received numerous complaints about transmissions from my D700. I
tracked it down to digital noise that appears related to the GPS data
stream. When transmitting, there is digital noise on my audio whenever the
transceiver receives a GPS sentence.

I don't see how it could matter, but I use a tripmate GPS powered
externally. I use the supplied GPS data cable. The GPS is not
opto-isolated from the transceiver.

I know that at least one other HTAPRS member has the same problem. Has
anyone else noticed this same problem?

Has anyone solved this problem?

I can't tell from the Garmin site --

Will the GPS III+ accept the $GPWPL info that the D700s and D7As output
(puts APRS stations on your GPS screen)?

I have a II+ but the III+'s map display capabilities are intriguing.

If the III+ does accept the $GPWPL statements, the III+ might answer my
desire to see both street level mapping and APRS station posits on the GPS
screen.

Comments from any one running such a combo -- III+ with D7A or D700 --
would be appreciated.

Jon,

You're being pretty harsh considering you didn't bother to read what I had to say. The VX-5R is user modifiable, through the serial port, to transmit on a very wide range of frequencies. Something that, by your logic, the FCC would never allow.

Ralph,

The GPSIII+ w/D7A is probably the most common Kenwood+GPS combination. I have it, and it works just great. In fact, because of the GPSIII+ mapping, I have run into several other APRS hams who I wouldn't have noticed except for the icon that popped up on the screen.

For instance, while stuck in a traffic jam on I-70 in Missouri, a WU2Z icon appeared on the screen a few miles behind me. From the display, I could clearly see that he was also on I-70 and stopped. Turns out Keith was also stuck in the traffic jam. APRS messaging ensued. ;-)

The only downside is that the GPSIII+ redraws the screen with every new waypoint position, so if you get in a congested area, it's difficult to use the GPS. Zooming in helps, as this reduces the redraw time.

Hi Ralph

The GPSIII+ definately works with the D7A and plots everything fine on the
maps. One useful tip is that the screen soon gets cluttered, however, you
can selectively erase all of the 'radio' positions as they use the default
icon. Just make sure you select a different icon for the waypoints you want
to keep!

Folks, note the difference between "NEMA" and "NMEA". They are not the
same at all. If memory serves correctly, NEMA stands for National Electronics
Manufacturers Association, and NMEA stands for National Marine Electronics
Association. GPS units talk NMEA.

Rendered body type: text/plain

I was able to read my d7a data file into the D700 SW and write it back to
disk, somewhat larger size 3k->4k. The d7a is the original version so I
cannot do the test you asked about..but am very interested in your
results.

To the SIG: Sorry if the answers are a little redundant, I've gotten a
number of these questions recently.

> I have just go my self a HP 430 H/Pc and loaded your winCE. Wow very neat.
> Could you tell me what type of maps I can put into it. I hope

> that they are
> the same as the ones for WinAPRS. If so where do I stick them as the unit
> has no maps on them at the mo.

You're in luck. It reads Win/MacAPRS, pocketAPRS, and dosAPRS maps. Get
them downloaded into *any* directory on your CE box, and APRS/CE will find
them.

NEMA is about explosion proof enclosures and such.

238. [htaprs] SUNSAT Downlink.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 25 May 2000 20:16:56 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86431-2000.05.25-19.19.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just went out from work to watch the first evening's SUNSAT pass
(a low 8 deg elevation pass) over the Atlantic on my Mobile
TM-D700 and can report the following:

1) I capture all packets that light only 1 or more LCD segments
2) I captured several minutes of packets even on this low 8 degree
   pass (yes, my mobile had a clear horizon to the east)
3) I noticed that during the day, I had captured packets from earlier
   passes from KB2WQM in NJ, KC8MZM in Akron Ohio and N5SUB in Texas.

ALthough my WEB page describes operations in detail, I thought I would
boil it all down for anyone who simply wants to leave the rig on in their
mobile and see what they capture. Here are the minimum settings to
CAPTURE packets form SUNSAT on your TMD700 mobile.

1) Set TNC APRS mode
2) Tune to 145.825 RECEIVE on band A
3) Tune to 436.290 XMIT on band B (and tune it during the pass)
4) Set APRS DATA BAND to RX:A and TX:B
5) Set APRS SPEED to 9600 baud
6) Set APRS PATH to SUNSAT
7) Set Packet rate to one minute or so
8) Set Transmit to AUTO
9) Add the wildcard * to your MESSAGE GROUPS

EXPECTATIONS: You will hear data bursts once every 10 seconds
which are the TELEMETRY packets. In addition, you will hear other bursts
if anyone digipeats or when SUNSAT sends a bulletin. The BULLETINS and
messages from others will be captured and displayed. To see the
TELEMETRY or other raw packets, press the PACKET MONITOR (P.MON) button.

Start your uplink on 436.280 at the beginning of the pass and end on
436.300 at the end. But with typical trees and buildings, you probably
only need to concentrate on the central .285, .290 and .295 uplinks.

DO NOT: DO NOT just leave your tranmit ON during the evening. The
mid-USA pass is always a VOICE pass and we are NOT authorized to use
packet during voice passes. Please. But DO Go out and listen to it if
you havent heard it before. Its Great fun.

So there you have it. Mobile-to-Mobile live packet communications. FOr
details: http://web.usna.navy.mil/~bruninga/astars.html

Your OLD THD7 will also receive these packets in TNC-PACKET mode with a
laptop, but the NEW THD7(G) can operate 9600 baud in APRS mode and so it
will capture all the above packets directly to the screen, just like the
mobile. (And the old ones can be upgraded...)

Enjoy
de WB4APR, Bob

P.S. It is OK to set the squelch. There is enough TXD to get the packets
anyway. Besides the difference between OPEN Squelch and 9600 baud is so
slight you might not even notice them. But with the squelch, they are
clearly there...

Well, it looks like those of us with the "G" version of the TH-D7A are stuck
without software. After getting the radio reset by the upgrade, I thought I
would fire up the Windoze emulator on the Mac and save the configuration.
Since some folks said they could read in the TH-D7A data files with the D700
software, I decided to download and try the D700 software.

Well, it doesn't work. It comes back and says "Invalid Radio."

So what do we do?

Now I've got two things I want to program: TH-D7A (G) and the VC-H1 and I

can't get either to work!

> > get that done...

Here's a "well, duh!" for ya! I started browsing through the network
connectivity code that I had been working on a little while back and it
looks like there is indeed full two-way capability - I had already
incorporated Steve's password gen algorithm and the logon string, etc.! I
had a quick keyboard chat with AA3JY today, with my palmtop being connected
only to the 'net. (How the heck did I forget that I finished that piece of
code? :-\ Neural overload, I guess.)

I did make a tweak tonight that makes the "user experience" a little better,
especially when connecting to port 10151 on www.aprs.net -- I lowered the
'net read thread priority one notch. Now the main thread (UI, drawing,
etc.) takes precedence so there's less apparent contention for the machine's
"attention". I had the full APRServe dump going on my machine, several
thousand stations. (List stations is *really* slow when you have a couple
of thousand stations in the list - I need to work on that... note to
self...) The tweak will be in the next build that goes up to ftp.tapr.org.

Anyway, just wanted you APRS/CE'ers out there to know that Build 691 has
two-way TCP/IP connectivity.

As I am the author of link7 (and eventually link700), I guess a
progress report is in order. My new new program, link700, was
going along really well, and quickly, until I hit a snag: the
computer I was using for development had only 48 Meg of memory
and I ran out of space for my IDE to run and debug the program. It
took me a couple of weeks to put together a new computer. I now
have 256 Meg , so I shouldn't have any more problems in this
respect.

link700 will do everything link7 does, for the TM-D700 as well as
the TH-D7. It will allow you to bring up multiple profiles (sets of
data) for the 'D7 and 'D700, and to cut/copy and paste from one
profile to another, e.g. if you want to copy channels in your HT to
your D700, just copy and paste. The new "G" version of the TH-D7
will be supported as soon as I can get/work out the new codes (
anybody out there figure them out yet?). I must say I'm anxious to
get mine converted, just to clear up that major annoyance, of a
packet display capturing control of the whole radio, and requiring
an extra push of the PTT to transmit. That has been my biggest
complaint about the 'D7 and 'D700 all along.

The suport for link7 has been gratifying. I have even had a
volunteer for beta testing link700, and I haven't even asked yet.
Thanks for all the support and keep a watch on my URL for
updates:

http://www.qsl.net/wa3hrl/

Yes, the web site needs some development, but if I spend the time
on doing that, that's less time I have to spend on link700.

The eTrex has NMEA output and it includes $GPGGA and thus Altitude data. In addition to NMEA, the eTrex has Garmin's "Simple Text Output" (STF) which included altitude. STF supplies in a 56 byte packet, Date/Time to the second, 3D Position (easting, northing, altitude) and 3D velocity which included vertical velocity. The other thing the eTrex does, is stores Altitude data with the Internet Tracklog and with Waypoints. The biggest disappointment I have with the eTrex is the user interface and data displayed. But maybe Garmin will "fix" this in future updates of the firmware. They certainly have improved the eMap since the first iteration.

Rendered body type: text/plain

I will be shipping the backorders, and able to accept new orders as well.

The order form and construction documentation are found at:
http://www.c2-tech.com/~steveb/hamhud/

249. [htaprs] Which GPS Engine??

From: Jack Chomley <chomley@telelink.com.au>
Date: Sat, 27 May 2000 09:24:04 +1000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86699-2000.05.26-18.09.08--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi APRSologists,

I currently have a Garmin 38, which works very well, however
it chews batteries and my interface cable is not set up for
external DC power connection.
I am looking for a GPS Engine to replace it with, that runs
on external 12vdc, is compatible with PacComm/Kantronics TNC's,
also my TH-D7A. And of course....a price that won't send my
bank manager into horror mode!! (Is THAT possible!)
Any ideas appreciated.

>I've got a feeling that the reason why the radios are not user upgradeable
>is due to FCC certification issues. It could be that having a user
>upgradeable radio would be something the FCC doesn't like.

I would buy into an FCC argument IF the user could change settings that
defined how the radio operated. But as that would entail modifying the
binary image file that flash upgrades use, I find that really an unlikely
argument. Espically as users adding/removing diodes and jumpers from the
motherboard can achieve many of the same results.

If Kenwood only provided "type accepted" upgrade files, then the only user
modifiable settings allowed would be the ones available through the normal
configuration utilities or front panel programming procedures.

If someone really wanted to modify binary code, they could always get the
spec sheet of the memory drvice, figure out how to read the data out, change
it, and then load their modifications back in.

Finally, if the FCC, and thus the manufacturers, were that concerned about
user modifications why is the ability even present to allow unauthorized
transmissions (such as out-of-band mods) at all? By allowing someone to make
hardware mods to take advantage of these "hidden" abilities they are in
effect allowing it to happen anyway. It they were that concerned it
shouldn't be allowed in the first place.

Arguments that flash upgrades may add another buck to the price or otherwise
create other unacceptable design problems are much more likely arguments.

> firmware. They certainly have improved the eMap since the first
> iteration.

On a whim I went out to the local Service Merchandise and bought on last
week.   I had not really researched it alot but knew it could provide NMEA
output that I wanted (I don't have a cable yet for it.)   When I powered it
up, I came to a very similar impression to what Brent says above.

It doesn't even show Lat/Long!   I guess it will make a good GPS for very
portable use with a D7 (i.e. bike, etc.) otherwise.

I guess you could call it the dummy's GPS -- or something between a
display-less GPS (Tripmate, et al) and fancier ones.

Rendered body type: text/plain

It is also likely that another country the TH-D7 is sold in prohibits the
use a flash upgrade. Remember we are not the only kids on the ham radio
block....we just represent the largest group with the same govt.

Lin N4YCI

253. [htaprs] APRS FIeld Day

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 26 May 2000 20:58:13 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86709-2000.05.26-20.01.13--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK, APRS is legal again on FD and this year we have two APRS packet
satellites. SO I just realized we need to be thinking about how we do the
"exchange".. Last year we wrote TAPR TECH DAY to count APRS posits only
separately from 2 way exchanges. THis year we need "2-way" exchanges.
Here is my take on this.

1) Put your FD Data in your POSIT. Such as 3A MDC (3 A Maryland DC)
2) Everyone else you SEE on the air, now then you put INTO a BULLETIN
  saying:
            "BLN1FDQSL:W3XYZ,WB4APR,W4YGH,W3ABC,W4HTP,ETC
3) Now, WATCH for similar BULLETINS from everyone else. FOr every station
   that is in YOUR QSL list and YOU see YOURSELF in HIS, constitutes
   a valid two-way exchange.

The only thing we have done here is "bundle" all your QSL's into one
packet. They are still TWO-WAY QSL's of the other persons data, if you
are in his.

The reason I am thinking about this kind of standard TECHNIQUE is two
reasons... 1) FOr satellites where BUNDELING will be a far more
effecient use of the channel. and 2) We can AUTOMATE it! hi hi...

One thing is to REUSE the SAME Bulletin numbers. That is, when you first
hear someone, then add them to your Bulletin. If you use the SAME
Bulletin number, then it will REPLACE the previous one and be far more
effecient. As follows:

After 1st stn BLN1FDQSL:W3ABC

after 2nd stn BLN1FDQSL:W3ABC,W4XYZ
               BLN1FDQSL:W3ABC,W4XYZ,W3XYZ,W5HIJ
               BLN1FDQSL:W3ABC,W4XYZ,W3XYZ,W5HIJ,WB4APR,W3STL

Etc. Here the BULLETIN number is the "1" character. By including all the
QSL calls in one bulletin, you improve the chances that the other stations
copy it while minimizing QRM. Once it is full, then move onto
BULLETIN #2. Then the decaying algorithm for APRS will concentrate on the
older bulletin less and less, and place priority on the new BLN2FDQSL
bulletin.

I havent read the rules exactly, (I dont have them with me) but I think
this will satisfy everyone. Right?

Rendered body type: text/plain

This mornings passes I copied 3 people and copied TELEMETR packet that
were only one LCD segment. THis pass I got up to 5 segments and never
decoded a single packet. Was it me?

I saw what I thought was digipeated packets from me. THey seemed to be
perfectly timed to when I transmitted. And I heard many bursts other than
the 10 second Telemetry bursts, so sounds like many others were getting in
too. But were YOU seeing packets too? Or not.

If not, then I wonder if the satelltie is putting the wrong PID on the
packets. ALl normal PACSAT protocol packets have a non-standard PID and
wont be seen by any TNC unless in KISS mode.

???

<in response to an email sent directly to me>

>>>Hi Jim, got my TM-D700 running, using WinAPRS 2.45. When the radio is
set to TNC PKT, lots of signal locations appear on the computer screen.
When in TNC APRS, all the incoming data appears on the face of the radio but
signal locations don't appear on the computer screen. Wondering if I messed
up a command for the computer or radio....when I open the WinAPRS VHF the
screen shows a "?" and won't run. Put the radio in the TNC PKT mode and
works fine. Is this the correct setting??<<<

Yes. For the benefit of other users, I've also sent this reply to the
htaprs@tapr.org sig and Bcc'd to the original sender [you know who you
are... thanks for writing].

The two modes, Packet and APRS, are essentially mutually exclusive. If you
want to use APRS software, the TNC must be in Packet mode because the
computer must control the radio's TNC and send the packets. When in APRS
mode, the radio processes all the data internally and will not output
through the serial port in a format readable by any current APRS software.

However while in APRS mode, you can enter the command AI 1 through the

serial port (that's alpha india space one), which turns on command output.
Simply, this will make the radio spit out data about the ongoing operation
of the radio, including codes if you change memory channels, etc. In this
mode, you'll see position reports in the format that the radio stores them
in memory. That is why I said "current" APRS software... I think a cool
addition to one of the programs would be the capability to parse the data
from this output mode, so you could monitor posits on the maps and send
messages from the computer keyboard instead of the radio mic. I'm not a
programmer, but I could assist any developer wanting to understand and
decode the ASCII data formats and commands the TM-D700A outputs while in
APRS mode.

I made an impulse buy on an eMap (actually got a very good deal) but I
chronicled it's shortcomings very well on the general APRS SIG a few months
back

Looking at their web site, I'll have to get the 2.50 update. But it's
still going to my brother as a wedding present.

Rendered body type: text/plain

Does anyone know of its possible to change the baudrate of the D700's
com port. It seems to be fixed at 9600. The abaud commands seems
to function, but only on screen. It has no affect on the com port. Or is
there some secret reset that causes the baudrate change to take effect.

Tnx,
Mike, WB8CXO

From: "myoung" <myoung@neo.rr.com>
> Do you know of a way to change the baudrate of the D700's serial port ?

Mike,

Looks like CP x will switch the communications speed between the radio's serial port and the computer. Here's a cut'n'paste from the chart on my web site...

Com Port CP 0 9600 bps (default)
CP 1 19200 bps
CP 2 38400 bps
CP 3 57600 bps

Use just   CP 1

for example to set to 19200. I just tested it and it does work. Odd, on page 4 of the TM-D700A specialized communications manual, the NOTE says: "You must not change the default (9600 bps) in Menu 1-9-5". But I was able to change from 9600 to 19200 and back with no problem. I did close and reopen the terminal connection to the radio after each speed change, and cycled power on the radio.

----- Original Message -----
From: "Christopher McNabb" <cmcnabb@4mcnabb.net>
> Could you please send me any info
> you have on the ASCII data formats and commands?
<for D700A>

Christopher, I am still working on more info, many people have sent me what they know so far on the D700A. Below is info relevant to all D700 users.

I first typed AI 1 at the serial port to turn on the echoing of commands and data at the port. The I typed LIST xx where xx is a number from 01 to 40. This spits out the text formatted, comma delimited data for each station. Comparing this data with what is on your D700 display would tell you what each field is for; but I am working on some more complete data for you if you need it. I strongly feel that with this LIST data, you could parse out the callsign, lat/lon, icon, and other relevant info for plotting on aprs software.

The Message data was discovered by typing AMSG xx where xx is 01 to whatever the highest message number allowed (I think 16, but I may be wrong).

Also I was able to enter a message from the serial port using terminal software by typing the following:

AMSG 00,N0RMO,test

The radio then responded with

AMSG 01,1,N0RMO,5,5,0527,0141,,test,0

to let me know this message was now in the list and queued (the second 5
indicates sends remaining). After I heard the ACK tone (morse K), I typed
AMSG 01 to see the listing for that message. The radio responds with:

AMSG 01,1,N0RMO,5,*,0527,0141,,test,0

AMSG aa,b,CALL,c,d,eeee,ffff,,text here,g

aa=message number in your radio
b=unknown for now
CALL=callsign TO
c=5 which= ?? I don't know
d=* = acked
eeee=date recd/sent
ffff=time
g=unknown for now

Write if you need more. 73
Jim N0RMO

I tested all the way to 57600 with TNC in APRS mode - works fine. Use the
info I sent you or Radio menu 1-9-5. Then power cycle radio, and refresh
the terminal connection to the radio.

261. [htaprs] Setting path on TMD700A

From: "Jim Gill" <gillj@uswest.net>
Date: Sat, 27 May 2000 04:20:36 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86776-2000.05.27-04.23.05--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

When you are mobile, it is hard to set your path in APRS mode by typing out
RELAY,WIDE,WIDE from the keypad or twisting the dial. Another way to do it
is through the serial port with a communications program by typing

PP RELAY,WIDE   or whatever you want.

A peek at the features list from the upcoming D7A(G) yields a better way to
enter paths... it says the (G) upgrade will allow you to enter R,W for
RELAY,WIDE or R,W,W etc., or W3 for WIDE3-3.

This doesn't work on the current D7A software, but it **DOES** work on the
current TMD700A software. Try it... set your D700 to APRS mode, go to menu
3-b (Packet Path), and type only W,W   -   then transmit a BCON. Your
packet will go out WIDE,WIDE!   W2 yields WIDE2-2! etc etc.

Then I wondered if I missed this in the D700 manual... yes I did. Page 24
of the specialized communications manual. It's been there all along - at
least this is a good reminder for those who may not have known you don't
have to enter the path longhand.

Rendered body type: text/plain

Hi All
       Unless I read the Field Day rules wrong. APRS is still not a
Legal mode for use at Field Day.
Yes APRS "contacts" that are made with out the use of digipeaters are
legal FD contacts. Nothing new here. The only change in the rules that I
saw is that you can now get 100 point bonus for setting up and operating
an
APRS station at your FD site.

> OK, APRS is legal again on FD and this year we have two APRS packet
> satellites. SO I just realized we need to be thinking about how we do the
> "exchange".. Last year we wrote TAPR TECH DAY to count APRS posits only

263. [htaprs] Sunsat Receive Only on D700

From: "Fred Hatfield" <hatfield@bellsouth.net>
Date: Sat, 27 May 2000 7:26:42
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-86791-2000.05.27-07.29.07--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

As a 'newbie' to satellite access, I have been following
the discussions here about Sunsat. As my first project,
I wanted to copy some of the Sunsat transmissions on my
D700 and hopefully have them displayed on the P.MON screen
like the ones displayed in an earlier message from the
Hamfest.

I set receiver A for 145.825, TNC APRS, 9600 baud, DATA as
suggested by Bob Bruninga in his message of 5/25/00. Since
I was attempting receive only, I ignored the transmit functions
listed.

However, when I switch to P.MON, I get a constant reception
of: "cmd:05/15/00 03:31:18" that is repeated every 21 seconds
updating the time entry and filling up the screen and buffer
area.

I know I must be doing a massive blunder somewhere, but resetting
everything and repeatedly setting the suggested parameters
doesn't seem to make a difference -- the P.MON screen just
continues to show the "cmd:05/15/00 --:--:--" nessage over
and over.

Could anyone give me a step-by-step setting for just a
'wait and copy' configuration to get some SUNSAT data?

Thanks for any help

Fred.

     That's how I read it too, but unless I miss my guess, there is an
exception to this rule: APRS contacts via PACSATs are acceptable ... and
give both the packet and satellite bonus points. Brother, those PACSATs
are gonna be busy on FD!   73

P.MON also sees ALL traffic between the internal CPU and the TNC> There
is LOTS going on. Lots of handshaking. The UNPROTO command needs to be
changed TWICE for each message packet sent, etc..

Yes, it is kinda messy. TUnr off NMEA GPS input to clean up some of it..

I don't have the GPS input turned on. If the "cmd:mm/dd/yy hh-mm-ss" message

is constantly filling up the buffer and screen before the satellite even
shows up,
how can I copy SUNSAT data?

Oh well, I guess I'm learning. Thanks for the help.

Rendered body type: text/plain

A few years ago I had an e-mail exchange with Billy Lunt, the contest
manager at the ARRL. Unfortunately, he did not interpret the rules the
same as I had interpreted them in plain english. It was very clear that
the digital repeater rule was waved for satellites. His interpretation
was that the wavier only applied to the 100 bonus points and nothing
more. It is still not real clear in the rules for Field Day in the year
2000
since they are still using the terminology for contacts as QSOs. Since

a digital contact can be deemed a QSO it appears there should be no
reason for digital contacts to fall within these rules.

If you read the ARRL Field Day rules and then read the "General Rules
for All ARRL Contests: you will find that in the latter it is permissable to
use Amateur Satellites as repeaters and digital repeaters as identified
in section 3.7.2 of the General Rules.

<snip>
3.7 Contacts made through repeaters, digipeaters, or gateways are not
permitted.

    3.7.1 This applies to all forms of active relays or repeaters.
    3.7.2 Satellite contacts, where allowed, are not subject to this rule.
<snip>

And in the ARRL Field Day rules for 2000 the following is stated:

<snip>
7.3.7. Satellite QSO: 100 bonus points for successfully completing at least
one QSO via an amateur radio satellite during the Field Day period. Under
the "General Rules for All ARRL Contests" (rule 3.7.2.), the no-repeater QSO
stipulation is waived for satellite QSOs. Groups are allowed one dedicated
satellite transmitter station without increasing their entry category.
Satellite QSOs also count for regular QSO credit. Show them listed
separately on the summary sheet as a separate "band."
<snip>

Here is an e-mail comment direct from the ARRL contest manager in 1998:

>-----Original Message-----
>From: Lunt, Billy, KR1R <blunt@arrl.org>
>To: Tim Cunningham <cunninghamt@usa.net>
>Date: Friday, June 26, 1998 11:21 AM

>you can use packet for your satellite bonus points contacts.
>
>73,
>Billy Lunt, KR1R
>Contest Manager, ARRL
>kr1r@arrl.org
>

I was shocked. After a few follow-up emails with supporting documentation
to support what I beleived, Mr. Lunt decided to stop any correspondence
on the issue. I think the real reason he decided to stop corresponding on
the topic was my point was very clear.

Our club has never used the digital contacts in counting our total Field
Day points, because the ARRL contest manager in the past has
contended they could not be counted. The rules are very clear to me
and I never understood why the ARRL told us our digital contacts via
the satellite would not count toward point credit in the past.

I will once again attempt to have this ruling clarified this year to see if
they have changed their stance on the issue.

Rendered body type: text/plain

After reading things a little closer in the 2000 ARRL Field Day
Satellite Bonus point section, I did find a hint that digipeater
operation may be the target of exclusion on the satellites, but
I will await clarification from the ARRL on this matter.

If you read the Satellite Bonus section in the 2000 ARRL
Field Day Rules, you will find the following sentence:

<snip>
Under the "General Rules for All ARRL Contests" (rule 3.7.2.),
the no-repeater QSO stipulation is waived for satellite QSOs.
<snip>

They have specifically stated the no-repeater stipulation in the
2000 ARRL General Rules for all contests, but made no specific
mention to waive digipeater or gateway operation as also
covered under rules 3.7 and 3.7.2 as being waived for satellite
operation.

There are 2 types of satellites that can be used in digital
operation. One type is specifically a digipeater, but if a
satellite used in repeater operation is used for a digital
contact, then this type of operation would be allowable under
the current ARRL Field Day rules.

I sent a note to the contest manager for clarification and will
update everybody on the response.

I got the upgrade to my TH-D7 at Dayton. Now when I try and interface with
WINAprs or anyother of the tracking programs, the TNC doesn't seem to be
recognized. Do I need to change the set up or wait for a upgrade to the
APRS software. Anyone know?

I guess I could see his point. Prior to APRS, the PACSATS in general
offered NO WAY to have a LIVE QSO. I can see how
message-store-and-forward did not fit into his concept for an "exchange".
BUT NOW, we can have LIVE 2-way digital QSO's with APRS, and so I agree
with you. THey should COUNT.

What I want to do is put our "APRS way of "multicasting" into a 2-way
context that is on "par" with other field day contacts and that allows us
to "talk" aobout our communications "success" in terms comparable to the
other modes at FD.

Whether the "contesters" at ARRL actually use them for "score" is their
problem. I do want bragging rights to all QSO's I make via satellite! hi
hi..

> I will once again attempt to have this ruling clarified this year to see if
> they have changed their stance on the issue.

Be sure to point out the "live" nature of 2-way UI packet digital
contacts...

Go get em!
Bob

I paniced when I tried APRStk and it would lock up the radio when it
ttried to autotune the radio to a satelite pass. But then I found out
that since the D7 can now do crossband TNC, that there are now 4 settings

for "APRS" band and 4 settings for PACKET BAND, and so you have 8 possible
ways to have it in the wrong mode. That was my problem. I had the TNC On
band A and the software was trying to control band B... and I had it in
single BAND nmode only.

Once I figured that out, it worked fine.

Rendered body type: text/plain

Even if you dont have an upgraded D7(G), ANY THD7 can be used with a
laptop to receive the digital satellites. SO dont wait for the
conversion if you want to play now.

With the old THD7, just connect the laptop, put the D7 in PACKET Mode and
with the PC, set the HB command to 9600 baud. YOu should have no problem
receiving the downlink from SUNSAT on 145.825 on a whip antenna in the
clear.

ALso, you can receive any of the other 9600 baud birds on UHF with a
small 3 element or more handheld beam. But you might find UO22 on 435.120
+/- 10 KHz doppler the most interesting since it also allows UI
APRS type UI digipeating. THis is an unpublished and un-announced
test... so keep it to this sig only. Thanks.

I have tried to digipeat via Sunsat SO-35 with no luck.
There must be something in my settings or transmit
frequency causing the disconnect. The downlink is
going through the Satellite Gateway on this end with no
trouble.

Perhaps, there is something missing in this recipe
for my uplink
.

This is what I am using:

Up: 436.291
Dwn: 145.825
+/- Doppler on the uplink and downlink is used.

Unproto: APRS via SUNSAT

Maybe I should be using APRSAT-0.

I have attached a log from the last pass this morning,
28-MAY-00 at 14:01 UTC.

For those who have been successful what are your
settings for the transmit side of your operation?

73's,

Tim - N8DEU
Huntsville, Alabama

Rendered body type: text/plain

To work SUNSAT, "you dont need no stinkin tracking program!"

SUNSAT's orbit is just a circle going up over the poles that is fixed in space. Due to the rotation of the earth, your QTH will pass under that orbit twice a day, once in the morning and once in the evening at exactly the same time every day around 8:20 AM/PM Daylight Savings Time in EVERY time zone. (Since time zones are 1 hour wide, this time can be off as much as 30 minutes depending on where you live in your zone.)

Problem is, we dont know where the satellite is in its 1.6 hour orbit. Think of yourself traveling east down the interstate at 60 MPH (earths rotation) towards a high overpass (orbit) that you will pass under at 8:20 AM/PM every day. The train (satellite) runs every 95 minutes, but you dont know WHEN. Your radio range to that train is about 2 hours due to curvature of the earth.

Depending on the timing, you will get either 2 or 3 opportunities to work the train. If it happens to pass over at 820 at exactly the same time as you pass under, then you will get an "overhead" pass and also an early LOW pass at 0645 and a late LOW pass at 0955. The train is traveling VERY fast, and so when it passes over, you can only work it for 10 minutes no matter where you are.

Knowing this 8:20 orbit time, it is simple to work the train:

1) Just leave your radio on from 7 to 10 AM and PM every day and work it when you hear it.

2) If you hear it real early, then it is to the east of you and you will get a great overhead pass in 1 hr and 35 mins and maybe a low western pass in 3 hours and 10 min also.

3) If you dont hear it till later say between 730 and 8, then this is a high eastern pass and you will get only one more high western pass in 1 hour and 35 minuites.

Now, since your D700 radio will time stamp packets, just leave the radio on overnight in your car on 145.825, 9600 baud APRS. If you are a late commuter like me, if there was an earlier pass, then you know exactly when the next pass will be. If there was not an earlier pass, then you will probably get one in the next few minutes...

One other thing. The SUNSAT team schedules the bird for a single VOICE pass in the evenings on the orbit that is closest to the CENTRAL USA so everyone can work it at one time. These passes are posted daily. So add or subtract 95 mins to konw when you can work it with APRS in the evenings.

CAVEAT: These are approximations. I am at home and don't have any current keps or tools to get the exact times and period, but this should be close enough. ALso, the 8:20 passing can change over the year depending on whether it is sunsynchronous or not. We can refine this model to be more precise if needed.

ALSO, UO22 which can also be used for APRS digipeating on an unofficial un-announced basis, has a pass time of 8:30! Yes, their orbits are 10 minutes apart in space relative to the sun, but where the sats are relative to each other at any point in time can be as much as 45 minutes apart. These days, they are about 40 minutes apart I think.

One other thing... since it is NORTH bound in the morning and SOUTH bound in the evening, you can even estimate which way to point your antenna if you are using a handheld beam, simply depending on what time it is relative to 8:20.

Plenty of things to keep you entertained during your morning commute or
evening prime-time play time.

> correct?

The first few tests we did with SUNSAT were in that mode. Now they have
decided to poperate with the stroner 2 meter DONWLINK so that everyone can
hear the satellite. SO edit the SATFREQS.SYS file in the APRS\SYSTEM
directory.

But *dont* set APRStk to auto-tune SUNSAT. Current versions of APRStk
will set the 2 meter downlink to 1200 baud and you will miss everything.
THis is why I am madly working on APRStk to change it all around...

but no prognosis in sight for a week or so...

I woiuld say this as "-/+" doppler not "+/-" doppler. For the uplink, you
need to tune LOW to start with and HIGH at the end. This is opposit from
what you tune the DONWLINK. Im sure you are doing this correctly, but
sometimes we overlook the obvious?

Otherwise, ti should work... via "SUNSAT" or "APRSAT"

Hi

Some time back some kind person sent me details on how to get rid of the KAK worm virus. DON'T PANIC I
don't have it ! Well I have another PC that has it on and I can not seem to find the info that was sent
to me. The stuff I have found on the web has not been to useful as it is still there.

Could that kind person resend the info to me. I only have a few days before it kill the PC and takes my
network down. Norton's anti-virus does not kill it very well as I have this on the main server and it
detects it but does not kill it in its trakes.

Many thanks

Hi

Some one made some very nice maps for Southern Africa for win/Mac APRS. The maps I am referring to are the southafr.zip maps on the ftp site. The only prob with them is they do not cover the only part in South Africa that APRS is taken place. Namely Johannesburg to Durban in Natal. They are quite nice and I would like to get one for this area. Could some one make them up for me or point me in the right direction to have them made up.

Many thanks

> > waiting for the window of opportunity....

All you need is someone in your local area running APRStk on an old DOS machine with a TNC. APRStk will transmit to your local LAN on 144.39 two things:

1) Once every 10 minutes, it will sendout a DX spot to your D700, THD7 or APRS software DX list, a schedule of all satellites that will be in view in the next 80 minutes.

2) WHen a satellite comes into view, it will transmit that satellite as a moving object that will show up on everyones screens. COmplete with the frequency and doppler! Also the Kenwoods will then display to the user the RANGE and DIRECTION to the satellite. When it gets within 1000 miles, they can work it.

Thus anyone monitoring 144.39 has all the info he ever needs to work any of the 7 satellites workable with a dual band mobile.

See http//web.usna.navy.mil/~bruninga/astars.html

I have found that the diameter of the 3/32" plug is critical on the
TH-D7A. I have a couple that don't make contact unless you twist the
plug just right and then don't breathe on it. The supplied Kenwood plug
works just fine.

Rendered body type: text/plain

I make and sell the following cable:

        Garmin to Kenwood D7 or D700.

This cable comes in a couple of flavors:

        Garmin connector with 2 3' cables coming out
        one to the radio and one to POWER
        This is my STANDARD cable
        $25

        Garmin connector to just the D7/D700 connector
        Normal length 3', but can be up to 6' long
        $20

I am trying to find Cigarette plugs at a good price so I can sell the
power cable with plug already installed. If I get these, they will be
$30 with the plug.

If any one wants any, I will have some more to ship out this week.
(I sold all I had at Dayton, and had to re-order supplies)

it was great to meet you hams at Dayton, and I registered my winaprs
software and it has made my ham APRs life a lot better

yes,   144.39 was back to back rf and packets.

there were so many collisions, thought my radio was not working since I
could not get in!

for sure going back next year.

I think I might bring a cow with me since some ham had a lamp with ATV and
another ham had a dog with tracking

hey...that was a goat not a lamp..typo error   duh

i would not mind having one of those old eng trucks with the mast for aprs
in the desert here in nevada

i liked the hams that were selling 807's at cost that was a real public
ham service

thats how you get typo errors too many 807's

Keith,

Don't use a cheap and nasty plug.....better to pay
a little more and have a reliable plug :-)
Incidently, do you use right angle plugs for the
radio end?

Rendered body type: text/plain

Hello,

Well Dayton was fun. First time I drove out and it was fun having the D700
along in the car. Wall-to-Wall packets. I think my TX time was 5 minutes
in the mobile with the status 1/2 the time. I normally run TX times of
3 or 5 minutes around Boston and wonder if that is okay. I got a good test
of my new Arrow antenna at the APRS pizza bash.

I setup a station at my hotel with the D7. I had problems with the batteries
going away. I did get enough to see all these stations moving around. If
people want copies of the raw logs email me and I will zip them up. Are there
any post-processing programs to remove dupes, etc???

I will be more prepared for next time as I got a suction cup antenna mount with
an antenna so the Radio can reach the power supply. I also need to get a better
power supply as high power caused TNC resets (Low Power OK). My room was
facing away from N8APR so I needed to careful put my antenna into a hot spot.

Of course I forgot my PG-4W cable so I needed to jury rig something. Fortunely
I had a sub-mini stereo jack to DB-9 adapter so I just needed s 3.5mm to 2.5mm
adapter, a stereo mini to stereo mini cable, and a couple of data line filters.

After my trip down to NYC on the train with the old Garmin connector cable
(Garmin Plug to DB-9 with a cigarette lighter plug cable) I decided to redo
the plug and be modular. The garmin cable now has a Stereo Sub-mini plug and
a 5.1/2.5?mm (big) inline coaxial power jack. I can plug into the Mic-E
directly, into the D700A or D7 with a 3.5mm to 2.5mm stereo adapter, or the
laptop with the previously mentioned 3.5mm to DB9 cable. I got a coiled cord
designed for a radar detector for the power. Amazingly the big coaxial plugs
and jacks do not slip apart under normal use. So now if I take the garmin
on another train trip I can pack the power cord away. The next thing is a
"splitter" so the GPS can feed both the D700A and the D7A while in the car.

Rendered body type: text/plain

well is was cool in Dayton

I mean the weather

we found a neat restaurant out of the city....it was the "hogs head" or
boars head.....I am sure it was not the hams head but I look forward to
going back there next time. we had a group of about 15 hams

we should require GPS to get there.

I think we should find a restaurant and not list the name but give GPS
coordinates only to get there....

I stayed with another ham at the airport area hotel....

we really had a great weekend with the hamvention..I had the th-d7 the
Magellan GPS and   a 5/8 wave mag mount.

the aiport in both directions checked my baggage.

told the checker in Vegas the antenna element was a fishing pole and be
believed it. the supervisor who is a member of the local radio club
recognized me,   well....he know it was not a fishing pole.   it was a good
laugh.

the security in Columbus Ohio inspected my bag after Dayton....they took
apart my Magellan adapter box and the cigarette lighter plug. I had my
thd-7 and the th-d7 wrapped in dirty clothes......the 5/8 wave
antenna......they did not believe that it was an antenna because I had if
flexed in the carry 0n bag.
the security person had me power up the Th-d7 and it spit out the
coordinates. he was a x military guy and it really got his attention. when
the Magellan booted up he got real excited.

I said"is the is the first time you had ever seen GPS in baggage?"

oh well he was not amused

the pilot of the another flight   aircraft happened by and he knew it was a
Larsen mag mount.

he had just returned form the hamvention.

bad news is he was flying to new jersey.

on the way back to Las Vegas, I plugged my own headsets into the armrest to
tune around way before the movie started.. a passenger 4 rows over said
"what are you listentin to?"

I said trying to work DX!

he knew what dx was and had been inactive in ham radio for over 10 years.
we talked all the way back to Las Vegas.

told him all about repeaters and APRs and packet.

gave him my phone number at the TV station in Las Vegas soon as he gets a
rig.

that was a short 2,000 mile trip.

never can tell where you will find those ham radio operators

find me on a map! go to http://map.aprs.net/kd8s-7

 You can make the cable with a $3.96 cable from Mouser and abput
$2.00 worth of DB-9 and shell from Rat Shack ... maybe another $3.00
for a snap on ferr"John W Wilson" <z004391b@bc.seflin.org>
ite core if you want to go really first cabin.

 The stereo plug is 2.5mm which is larger than 3/32's (2.38 mm).

 Not trying to be a smartass here but ... big deal! You can do that
with any cable, hell you can make separate cable that doesn't need a
null modem for less than Rat Shack sells the null modem adapter. You
can make the cable with a $3.96 cable from Mouser and about $2.00
worth of DB-9 and shell from Rat Shack ... maybe another $3.00 for a
snap on ferrite core if you want to go really first cabin.

 The stereo plug is 2.5mm which is larger than 3/32's (2.38 mm).

$54 bucks for the cable and CD is too much. The only thing on the CD
you cannot get elsewhere is a PDF file of a manual that by rights
should have been shipped with the D7.

  Yeah, but the cable itself that Kenwood ships is garbage. Most guys
have wound up butchering it when trying to make a cable. The Mouser
cable is the best.

Brian,

I guess I am spoiled. I have turned into a real appliance operator these
days. Plug and Play baby!! Used to build my own PC's, not anymore.   Used
to build my own trackers, not anymore.   Used to build my own cables, not
anymore.   With my work/travel schedule the way it is these days it cost me
more to build than to buy. Building can be more enjoyable but buying lets
me conserve my most valuable commodity of all, TIME. Heck that is why I got
the D7 and the Garmin Streetpilot anyway. PLUG AND PLAY. You do make a
great point however, if you have the time BUILD, SAVE AND ENJOY!!

73's,
Jim
KA3TTU

I wondered what was wrong...

Bob
---------- Forwarded message ----------
From: Johann Lochner

Hi folks,

We just had a Sunsat pass. Corruption of a critical variable caused
a reset of all onboard systems at around 8:30 UTC, this morning.
This is to be expected for systems exposed to the high radiation
levels in space. Single event upsets can be detected and corrected
in many instances, but will cause fatal errors sometimes. This is
about the fifth time that a SEU caused a reset during the 15 months
since the launch. We hope to reload all digital and voice schedules
during the next pass.

Regards,

Johann

Okay, I have an off the wall question.

What about APRS contacts made from a remote station? I plan to launch a balloon
at our companies annual picnic (just happens to be field day). I am thinking
about putting my 386 SBC on board the balloon with APRSdos. It can redirect the
386 SBC i/o to a serial port. I am thinking of putting another TNC on this port
so I can operate the APRSdos remotely (from the ground). Since the APRS contact
would be with the Balloon station wouldn't that count? The fact that I'm
operating the station's keyboard/display via a rf link shouldn't make any
difference should it? ;-)

Don

Can anyone give me a "best guess" as to how long the (G) upgrades are taking
from Kenwood? I have two D7's that I would like to send to the eastern
service center for upgrade, and I have a Canada trip coming up that I would
like to take them on. I leave June 17... just wondering if I sent them in
tommorrow, would they be back in time... or should I only send one to make
sure I'll have at least one for the trip.

And BTW, could someone fill me in again on the address for the east service
center?

Thanks...

I talked to Paul, the manager at Kenwood at Dayton. He said the radios with
the new software will probably hit the shelves after June 1st. Who knows
though how much stock your dealer has! Between now and then though, I
think Kenwood will upgrade any newly purchased D7A for free to the "G"
version.

Give Kenwood a call. Their customer care is VERY supportive or send them an
e-mail asking this.

I just signed on to this web site in the past week and haven't had much time to poke around. What is all the talk about the software updates to the TH D7?? I bought my HT in January and really enjoy it compared to the old "brick". Where can I find out about the software upgrade & what they will do for me?

    Also, I was putting the canvas Kewood case on the HT over the weekend and the rubber light button pulled out. Has anyone else had this problem. I'm contacting Kenwood to see if they will send them to me.

>of Kenwood which so far has worked flawless, I still
>have problems paying for their problems. How does the
>rest of the group feel? I wouldn't mind picking up
>the shipping costs but that's it.

My radio is 1 month old and crashes all the time. The APRS triggered lockups and the power mismanagement corrupt the memory of my channels regularly. The split offset gets changed to values which display as jibberish. The transmit will no longer occur when I push PTT. I have to go and reconfigure the offsets (if I don't have a PC handy to reload the radio). This makes the radio extremely unfriendly to use.

I can not believe that the radio will not transmit on L when powered by the AC charging wall wart. If the TNC is on, APRS is active and the other band is set to EL even, the radio occasionally reboots on an APRS beacon. I find this completely unacceptable. If I try and transmit on the other band (with EL selected) while the TNC is set to packet mode, and I am hooked to the AC charger, I often experience the radio loosing power and rebooting. This inability to operate reliably with what came in the box is just nosense!

I believe that we should be obligated to no more than shipping, and I wonder if radios bought within the past 90 days of age should not be covered with zero net cost to the owner!

Yes, I have experienced the same problem several times. And yes, it has happened while operating on the internal battery. The only recovery that I have found is to do a complete reset and a complete reprogramming of the radio. No, that is not convenient when I am in the mountains and it locks up. At those times I just program the bare necessities of what I need at the time. When I get home, I reset it again and reprogram it from my computer. Piece of cake that way. For as much programming as is required for these hi-tech toys, I consider the computer programming link as mandatory or you will really get frustrated when the microprocessor hangs up or the program crashes.

Hopefully, the (G) version will correct this problem.

I would never attempt to operate my radio on the supplied charger. It is just what it says, a battery charger, not a power supply.

> I believe that we should be obligated to no more than shipping,
> and I wonder
> if radios bought within the past 90 days of age should not be

If your radio is that new and you are willing to loose it for a while, I would send it back and explain the problem to them and see what they will do for you under their warranty. I elected to live with this minor inconvenience since I really do not expect anything that small with all these features to always run flawlessly. I have never had a computer that ran flawlessly either. It is just the nature of the beast.

I still love my TH-D7A's (yes, I own two of them) and intend to send them in for upgrades as soon as a workable software programming program is released. Right now it would take too long to reprogram it by hand and I am satisfied with my current versions.

The only time I've remotely had anything like this happen is when I was
trying to run the radio off an unfiltered DC power cord in the car. Are you
trying to do this? You need the Kenwood plug.

>
> I can not believe that the radio will not transmit on L when powered by
the AC
> charging wall wart. If the TNC is on, APRS is active and the other band
is
> set to EL even, the radio occasionally reboots on an APRS beacon.

Your wall wart is not designed to power the radio on transmit. Wall warts
on not regulated power supplies. They put out a given voltage at a given
current. Once you draw more current than specified on the wall wart, the
voltage drops. What you are doing when trying to transmit is pulling the
voltage down that is being supplied to the radio. The radio can no longer
be powered by that and so drops out. This could also cause screw ups and
lock ups as you mention above. The wall wart is meant ONLY to charge the
radio not to power it. If you have the radio powered while having the wall
wart plugged in, the battery may not charge well either the manual is very
clear about this. It says to NOT have the radio on when the charger is
plugged in. This is standard operating procedure. If you want to power the
radio from DC, buy a DC power supply that is regulated and is designed to
carry the load of transmission.

>I find this
> completely unacceptable.

Why? You are trying to use the wall wart for a purpose for which it is not
intended.

> If I try and transmit on the other band (with EL
> selected) while the TNC is set to packet mode, and I am hooked to the AC
> charger, I often experience the radio loosing power and rebooting. This
> inability to operate reliably with what came in the box is just nosense!
>

Again, the wall wart was NEVER designed to power the radio. Why do you
insist on trying to force it to do something it isn't designed to do?

> I believe that we should be obligated to no more than shipping, and I
wonder
> if radios bought within the past 90 days of age should not be covered with
> zero net cost to the owner!

If your radio is REALLY malfunctioning, why not call Kenwood and send it

back to them for repair? After all, that is what the thing called a
"warranty" is all about. If Kenwood can verify you have a problem (and you
may have a problem) then they will repair it for nothing and they may even
give you the software upgrade at the same time for no charge.

But I think your radio works perfectly. What I really think your problem is
due to is trying to power the radio off the wall charger which is a NO NO!
Try charging the battery fully for 18 hours or whatever it is listed as and
then try operating the radio UNPLUGGED from the charger and see if it works
right. That's they way it is supposed to be done!

I can't believe how people constantly rip Kenwood on this reflector when
they have problems with their radios. Kenwood has a customer care line and
you can call them, e-mail them, etc. Every time I have called them they
have IMMEDIATELY worked to fix the problem and take care of things. I can't
say enough good things about the service I have gotten from them. So folks,
instead of b**ching about how your radio doesn't work right out of the box,
call the manufacturer. If they aren't willing to fix it then come on and
gripe all you want.

73,

Jon

I have the filtered kenwood 12v DC adapter for the car, that works perfectly
to power the radio and provide limited charging of the battery.

>Your wall wart is not designed to power the radio on transmit. Wall warts
>on not regulated power supplies. They put out a given voltage at a given

>radio from DC, buy a DC power supply that is regulated and is designed to
>carry the load of transmission.

My point is that if the radio powers up with the wall wart plugged in, then I would expect it to operate with it plugged in. In an emergency situation, or otherwise, I may not have an extra battery or the time to charge one. The wall wart should have enough current capacity to power the radio for reasonable use. At no additional cost, the wall wart could have twice the current capacity that it now has. Also, it could have provided quick charging of the Nicad battery packs as well.

This radio is an appliance to me, if I can connect something push some buttons and seem some results, then I draw many conclusions from those results. If the radio can power up and run without transmitting while the wall wart is connected, then I'd expect that it could have been designed with one of those single chip switching power supply chips that would have been able to regulate the current and voltage correctly. I have no desire to own 4 different power supplies/power sources/chargers for a device! Two, one for the car and one for the house should be enough. Needing purchase and carry around/find an AC charger, an AC, regulated power supply, a DC filtered power supply and an AC quick charger just doesn't do me any good.

If that little plug is doubling for charging and power source, then I expect that anything that kenwood would provide/sell that plugs into there would provide sufficient power for operating the device. The wall wart is huge compared to those that I use to charge my cell phone or my RC radios for my planes and cars. I guessed, incorrectly, that Kenwood would have provided a regulator in that package...

>Why? You are trying to use the wall wart for a purpose for which it is not
>intended.

That is Kenwoods statement, which differs from my expectations. I paid for that wall wart, and it is useless for my needs. I need to be able to plug my rig into whatever available AC power there is where I am operating. The battery should stay charged that way so that when I don't have external power provided, I can operate with a fully powered battery and know that I will have power for some period of time. As it is now, I have to operate at home, off of batteries and if at a moments notice I have to go operate someplace else, off of batteries, they will already be weakened and I will have to deal with that! At home with both bands operating and the TNC on, I lose battery power inside of my expected evening operating time and often have to stop early!

A single AC power supply and charger would make it unnecessary for me to have to do this and own 3 different AC power devices. I know I can build a Gel Cell backed power system, charging the gel cell off of the wall wart or some other low capacity source. But, that implies a mode of operation which I think is a choice for the owner to make (operating off of battery). It comes down to a simple economics lesson. If I can make a single AC power system for charging and operations, than Kenwood could have. This radio, with its high power requirements, should be capable of operating off of AC out of the box without extra expense. The $400.00 that I paid for this radio is way above the price of the typical dual band HT. The TNC and APRS support is part of that cost, but I expected a much better power management system for that price.

>If your radio is REALLY malfunctioning, why not call Kenwood and send it
>back to them for repair? After all, that is what the thing called a

>may have a problem) then they will repair it for nothing and they may even
>give you the software upgrade at the same time for no charge.

It is clear that the radio does not operate in a mode that I think would be appropriate for basic operations to be possible. It is arguable whether the misoperation that I perceive is a system problem or limitation of the design.

>But I think your radio works perfectly. What I really think your problem is
>due to is trying to power the radio off the wall charger which is a NO NO!

>Try charging the battery fully for 18 hours or whatever it is listed as and
>then try operating the radio UNPLUGGED from the charger and see if it works
>right. That's they way it is supposed to be done!

I do this regularly and get about 1.5-2hours of operations at home after charging. Thus, I need a different power source for these kinds of operations. But, since the charging jack and the power jack are one in the same, if I have to buy a larger capacity power supply, then why would I need the wall wart? I could charge using the higher capacity power supply.

Now, there is apparently no charging control built into the radio and thus if you put a large power supply into that jack, you may need to remove the battery to avoid overcharging it. So, in this case, I would need to use the wall wart for charging. But this is the point that I am trying to make. If a real charging and power system was built into the wall wart, then I wouldn't need both!

>I can't believe how people constantly rip Kenwood on this reflector when
>they have problems with their radios. Kenwood has a customer care line and
>you can call them, e-mail them, etc. Every time I have called them they
>have IMMEDIATELY worked to fix the problem and take care of things. I can't
>say enough good things about the service I have gotten from them. So folks,
>instead of b**ching about how your radio doesn't work right out of the box,
>call the manufacturer. If they aren't willing to fix it then come on and
>gripe all you want.

I like to voice my concerns and disappointments here to see if others perceive the same issues. If so, I'll call Kenwood. Otherwise, I'll just accept that my expectations are not in line with typical use and I'll take the extra expense and/or trouble to remedy the situation myself. In my opinion, it is very healthful for people to share their different expectations from what is on the market. It really does allow manufactures that are clueful to address issues and deal with markets that they can and desire to.

I rarely take peoples complaints as b*tching unless they contain language that would imply that they are truely b*tchers as opposed to someone whose expectations are just way beyond what the manfacture thought. If you want a great example of expectation riffs, go look at netpliance.com and what everyone wants to do with the I-Opener verses what the now documented business model is.

Kenwood will discover over the next year or so that there are a lot more appliance users buying their equipment than before. These people will still understand power consumption and battery technologies at some level, but I predict that they will be less tolerant of poorly matched equipment power consumption and battery based power systems.

makes the
> radio extremely unfriendly to use.

  You may have a bad radio, this is _NOT_ normal behaviour for the D7.
I have had my D7 for 16 months and in that time have had two lockups,
and they weren't even in a hi RF/APRS environment. I have no idea why,
I just unlatched the battery and reattached it and I was back in
business. I have spent some extended perios of time in the hiAPRS
traffic areas in NJ w/o any problems. I rotinely run my D7 on my desk
at school under EL with my D700 in the car digipeating in and out. The
D7 often runs for 4-5 hours at a time and no problems.

Now don't get me wrong, its not perfect ... there are some
design/operations problems ... and the (G) upgrade is supposed to fix
many of them ... but the D7 is basically a great little radio with a
lot of functionality in a small package.

> I can not believe that the radio will not transmit on L when powered

This
> inability to operate reliably with what came in the box is just
nosense!

   ... and from just which crackerjack box did you get YOUR power
management education. Just how far do you think an 80 ma power supply
can go with a totally discharged battery. It might just barely make it
on an EL transmit on voice but it sure won't power the TNC and
transmit much. If you want to operate 'out of the box' then plug in a
12 vdc supply with some juice behind it ... that will work just fine.

> I believe that we should be obligated to no more than shipping, and
I wonder
> if radios bought within the past 90 days of age should not be
covered with
> zero net cost to the owner!

  I don't know about 90 days but all D7's bought at Dayton I have
heard will be covered.

If you want quick charging, Kenwood sells a quick charger.

As for emergency operating, might it not be wise to have that spare battery pack handy in case you have no AC power? That seems to me the prudent option. To depend on a wall wart to provide any kind of power for anything in an emergency is suspect at best.

Also, you say at "no additional" cost the wall wart could handle twice the current. Not necessarily. It could have very definitely impacted the cost. Again, wall warts are rarely regulated devices. They are designed to output a given voltage or voltage range for a given range of currents. They are cheap. And that's all they are. Rapid chargers cost $60 because the circuitry to charge the battery is more expensive (and we live in a great economic system called Capitalism).
>
> This radio is an appliance to me, if I can connect something push some buttons
> and seem some results, then I draw many conclusions from those results.

Greg, I encourage you to step beyond the boundaries of being an appliance operator. While I am all in favor of the new licensing system and rules, I firmly believe that hams should be more than just appliance operators. We are to be skilled in the art of radio communications. That implies a LOT more than just operating an appliance and knowing nothing about it. If more and more people are going to be appliance operators such as you describe and can't even determine the limits for a power supply, then our hobby certainly is in trouble!

> If
> the radio can power up and run without transmitting while the wall wart is
> connected, then I'd expect that it could have been designed with one of those

> the current and voltage correctly.

To assume something like this is a dangerous proposition.

Let's see: If I buy a power cord for the car, that's one supply. If I buy a small couple amp 12 Volt regulated supply for the house, that's 2 supplies. Where's supplies 3 and 4? Sure, I can have a quick charger, but with the 12V supply, I don't really need one do I?

>
> If that little plug is doubling for charging and power source, then I expect
> that anything that kenwood would provide/sell that plugs into there would

Again, a dangerous assumption. Read your manual.

> The wall wart is huge
> compared to those that I use to charge my cell phone or my RC radios for my
> planes and cars. I guessed, incorrectly, that Kenwood would have provided a
> regulator in that package...
>

But do you power your AC radios and cars off the warts? I doubt it. Size doesn't mean anything. And my Kenwood wall wart is pretty small. The big one I have is for the rapid charger. The wall warts clearly indicate the load capacity on them. If one compares that to the specs given in the manual, one can then know if one can transmit with that wart.

> >Why? You are trying to use the wall wart for a purpose for which it is not

> >intended.
>
> That is Kenwoods statement, which differs from my expectations. I paid
for
> that wall wart, and it is useless for my needs.

Kenwood does not state that you can power the radio from the wall wart. In
fact they specifically tell you NOT to do so!

>I need to be able to plug my
> rig into whatever available AC power there is where I am operating.

What if all you have is 220 Volts? Should it operate on 220 as well?

> The

else,
> off of batteries, they will already be weakened and I will have to deal
with
> that! At home with both bands operating and the TNC on, I lose battery
power
> inside of my expected evening operating time and often have to stop early!

Greg, you can either buy more batteries or better yet, buy a small 12 volt
power supply. You could probably get one from Radio Shack for less than
$50. Then your problems are solved and you can keep your batteries charged
and ready for use only if you need them for that emergency. If agree with
you, you need to have communication capabilities in an emergency situation.
But relying on commercial AC power is not emergency preparedness. Having a
stash of charged batteries on hand is.
>
> A single AC power supply and charger would make it unnecessary for me to
have
> to do this and own 3 different AC power devices.

Exactly! And you can get one!

> If I can make a single AC power system for
> charging and operations, than Kenwood could have.

Yes. They do. You can buy Kenwood branded power supplies.

>This radio, with its high
> power requirements, should be capable of operating off of AC out of the
box
> without extra expense. The $400.00 that I paid for this radio is way
above
> the price of the typical dual band HT. The TNC and APRS support is part
of
> that cost, but I expected a much better power management system for that
price.
>

My FT-847 HF,VHF,UHF rig cost me $1500. It draws nearly 20 amps on
transmit. It did not come with a power supply. Just because a radio draws
a lot of power doesn't mean the manufacturer is obligated to supply you with
a means for powering it. The $400 you paid was for the radio. The wall
wart probably is worth about 50 cents in the entire scheme of things. If
you take a top of the line dual band HT and get a TNC such as a KPC-3, you
will approach the price of a TH-D7A. But then you won't have the
convenience of an all in one TNC/Radio/software, etc.

If you feel the radio is not worth what you paid for it because the wall
wart doesn't allow you to transmit with it, then perhaps you should sell the
radio on e-Bay or something. I'd make an offer on it if you were selling
it.

>
> It is clear that the radio does not operate in a mode that I think would
be
> appropriate for basic operations to be possible. It is arguable whether
the
> misoperation that I perceive is a system problem or limitation of the

design.

Sure it's a limitation of the design. No question. It would be nice to be able to hook up a straight AC power plug and skip the wall wart all together! It would also be great if the HT put out 50 Watts instead of 5 Watts. After all, I have difficulty hitting digipeaters with the rubber duck! But you have to draw the line somewhere.

> I do this regularly and get about 1.5-2hours of operations at home after

> wart? I could charge using the higher capacity power supply.

1.5 to 2 hours of operation is all you can really expect unless you have a high capacity battery and even then not much longer. The TH-D7A is a battery hog that's true. And it is a limitation that the batteries cannot be charged without them being on the radio (unless you have the rapid charger). And yes, if you got a higher capacity supply, you would not need the wall wart. You are correct.
>

If a
> real charging and power system was built into the wall wart, then I
wouldn't
> need both!

First of all, you can't really over charge the batteries when using a trickle charge method such as the wall wart. The wall wart doesn't have any charging control built into it either. It's a myth that you can overcharge nicads on trickle charge. Rapid charging is a different story. But in fact, in order to keep nicads good, you should keep them on a trickle charge rather than just let them sit on the shelf for long periods of time. So if the external supply is going to overcharge them, the wall wart will do the same. But it won't happen. Neither will overcharge the battery. Additionally, batteries typically have internal temperature sensing circuitry that will also prevent against this. However, the only time batteries really get hot while charging is while on the rapid charger. So now, you don't need the wall wart.

> Kenwood will discover over the next year or so that there are a lot more

We are ham radio operators. Part of our charter from the government is to be technically skilled. And I say this to all appliance operators out there: If you aren't technical - that's fine. But you can learn to be more technical than you already are. That's part of the great thing about this hobby. Always an opportunity to learn - if you are willing to learn and be taught.

Greg, please don't take any of this personally. I am not trying to insult you or attack you at any level. Rather I am just trying to help you and others who may have this same problem learn a little bit more about their equipment and what it takes to properly operate it.

73 es GL,
Jon

I am not suggesting that 80ma would do that...

My point is simply that the provided AC wall wart does not put out sufficient
power to operate in minimum conditions. This was a Kenwood design
decision, they could have provided more power so that it would operate
under minimum power with such a wal wart. I suspect they did not so as
to avoid battery overcharging problems, but still, that is another design
issue that could have been dealt with to provide a more robust power
management system.

> > My radio is 1 month old and crashes all the time. The APRS
> > triggered lockups....

I think they discovered this problem. Apparently if the radio is
in an environmnet like DAYTON or on a mountain where the squelch never
closes, and therefore the internal TNC never gets to transmit, then the
TRANSMIT buffer just overloads or something and that is what causes the
lockup. So one fix is to simply do what we are all supposed to do...
"listen to your radio".

Operating APRS without listening to the channel is like walking blind..
Im not saying everyone has to have the volumne turned up all the time, but
during any period of operations, you need to "monitor" the channel
just to hear what is going on. Your ear can tell you an
order-of-magnitude more information about the health of the channel than
your TNC can...

The other lockup problem of course is insufficinet power supply to keep
the internal TNC powered up, plus the two internal transceivers during
your 4 amp Transmit drains...

Just stumping.. No real point here.

de WB4APR, Bob

The reason that you are supplied with a low POWER wall wart CHARGER is to
eliminate overcharging and baking the battery. It's not the current
capacity of the charger that is important, but the voltage supplied to the
radio. The wall wart supplied with ALMOST every radio I have ever bought or
SOLD is designed to charge the battery over an extended period of time. It
iks NOT designed to run the radio. To run the radio , you need a device
designed to a different set of specifications. A CHARGER provides VOLTAGE
at a level higher than the battery design voltage so as to charge the
battery. A power supply designed to OPERATE the radio is designed to provide
a HIGH current at a voltage close to the battery voltage. You cannot supply
a power supply designed to do both at an economical price. Thats why the
MANUAL says NOT TO OPERATE the readi while plugged into the charger.

>

>

That is a typical requirement of commercial radios. It is accomplished by
using a drop in charger that will charge the battery separately from the
radio. Then you buy a second battery and swap them out as needed.

The only device I can think think of that comes even close to your
requirements is a drop in mobile charger/ power amplifier similar to the
Docking Adapters. They all cost hundreds of dollars. Your wall wart costs
$10.00 retail on the high end.

>A single AC power supply and charger would make it unnecessary for me to

price.
>

The $400.00 you paid for the radio is CHEAP! Remember what your market is
and who buys amateur radio equipment. We don't have unlimited budgets and
the manufacturers build these radios to a price point.
A similar radio in the commercial radio market is TEN TIMES THAT PRICE, and
it still CANNOT be operated from its charger.

>It is clear that the radio does not operate in a mode that I think would be

You are asking for something that does not fall within any manufacturers
definition of a BASIC operational requirement for a HANDHELD PORTABLE radio!
It is NOT DESIGNED AS A MOBILE OR BASE STATION!

 >I do this regularly and get about 1.5-2hours of operations at home after

>

I would guess that you are in less than 5% of the D7 owners that desire the
feature you are discussing.
This puts the desired enhancement in the area of OPTION, and we all know
that options cost more money.
Your expectation of a universal charger / operating power supply can be met,
but here would be the requirements.

1. Supply the requisite higher voltage to chatge the battery, but regulate
the current so as not to bake it.
2. Instantly sense the supply lines and switch from charge mode to operate
mode. IE: reduce output voltage and increase current at least tenfold to
power the finals.
3. Autosense the input voltage, frequency and if D.C> polarity. Allow a
voltage range of 12VDC to 240 VAC to allow for mobile and foreign operation.
Wait, lets go even lower on the input voltage to 6 Volts to allow for low
vehicle battery voltage or dropout on engine start.
4. Operate from D.C. to 100HZ input frequency. (remember foreign operation)
5. Provide plugs for all power recepticles world wide as well as all D.C.
connectors in standard use worldwide.
6. Keep the cost under $10.00

No personal attacks assumed.

Jon, I am a technically minded person, a software engineer with 15 years
of experience in that. I do have the ability to do all of the power
system analysis necessary to know that the wall wart won't work for
operating the radio. I have 20+ years experience with nicads from using
them with RC aircraft, so I know about charging rates, storage techniques
and other related things. In the RC industry, the radios must be off
for the charging circuit to be active. There is no opportunity for
it to be considered that one could run an AC cord out to your airplane
(or other model) and run the system off of AC while tuning the engine
otherwise messing with the model. If you want to provide alternative
power, you have to hook up the correct connectors to your power source,
unplug the batteries and plug in your source.

I can clearly see from the table in the back how much power is used/needed
for each part of the operations. I did read the part about "Turn the
radio off while charging." This is not what I am disputing.

I am arguing the fact that a remedial charger was supplied that could have
been (I won't say easily this time to avoid that argument), different so
that all the time that I am operating under normal conditions I don't have
to buy battery packs (of which I could charge only one at a time), or an
external, regulated power supply that would typically provide the 20amps
you mention when all I need is about 1 amp. Regulating 1 amp at 12 volts
can be done with a single switching power supply chip for a small cost.

I understand all the preparedness issues associated with the obligations
that some of us take on to provide emergency support. All Amateurs
that I have met (about 10 personally and many others have shared their
operating desires on the air for me to hear) have different needs and
contributions to make. Not all of them want to have 4 battery packs
charged and ready to go with a 20amp external supply to boot when that
would buy them a mobile rig to put in the car. To use this radio with
any real frequency I must be in the car with the DC adapter. If I had
2 or even 3 or 4 batteries, I'd still have to buy a quick charger to
charge them off of the radio, or I'd be stuck with serial charging which
would result in me getting bit sometime when I forgot to change batteries
and left 1 or 2 uncharged.

When I am ready to operate at home for extended periods without AC, I'll
be happy to buy a large gel cell and hook it all up.

Kenwood could have provided a nice power system for the device. They
did not... I think this is an oversight, but perhaps most other people
spending the $400 on this radio have more to spend on accessories than
I wish to.

Thanks for reflecting your thoughts back to me and hopefully I've said
enough to express my points. The radio is not a bad thing, it is just
a compromise (like most products) that ended up with an unfortunate
limitation that I think is really, really poor packaging.

Now, back to really important matters...

Rendered body type: text/plain

Tried calling Kenwood on and off all day today. Even got Cliff Uyeda's
voice mail. No one ever returned the call. However, I did get an answer to
when to expect the new D7A(G)'s on the shelf. Kenwood will start shipping
next week. If Kenwood had a coupon/certificate for the upgrade, I never
could verify this information - I just couldn't buy the radio knowing that
the upgrade was just around the corner.

Greg,

I refer you to page 2 of the TH-D7A manual.

Section: Charging the NiCd Battery Pack

1.) Confirm that the transceiver power is OFF
    * When charging the battery pack, leave the transceiver power off.

Sounds pretty clear to me!

It's also why the BC-17 is called a "wall charger" not "wall power supply."
See page 94 of the manual.

While you may be able to get away with transmitting from the rapid charger, it may not be the best thing to do in all cases. I don't know what it will do to the battery if you try to drain it while rapid charging it at the same time. It might do bad things. Someone who is more of a battery expert than myself may be able to comment on this one.

 ... what planet have you been hiding on ????? ... not one bloody
manufacturer, Icom., Yaesu, Kenwood, any of them, of ham handi-talkies
has ever delivered anything more than a wallwart capable of a .1C
charge rate for the Nicads with their basic talkie! So all of a sudden
you pronounce the D7 a failure because Kenwood did what they and the
others have been doing for 20 years or so ... ridiculous!

All day today (Wed.) I was attending the American Red Cross Orange County
Chapter Disaster Preparedness Seminars.

For anyone buying a TH-D7A from an authorized Kenwood Dealer will either
get the upgraded (G) version off the shelf or purchase the existing TH-D7A
stock for the regular selling price. There will be some customers who may
not need the additional features and would prefer the lower costs of the
regular version (TH-D7A).

>Again, the wall wart was NEVER designed to power the radio. Why do you
>insist on trying to force it to do something it isn't designed to do?

Perhaps people's expectations of the D7 have been set unrealistically high by ubiquitous devices that have a more flexible power management system.

Many rechargeable devices from low tech (shavers) to high tech (laptop computers) work just fine while charging, they simply get the required power from whichever location has it. A superb side effect is that there is a built in Uninterruptible Power Supply function when you operate from external power.

My Yaesu FT-50 works great this way too (it's charging cord *is* the external power cord); though my old RS HTX-202 does have the same charging/using incompatibility as the D7.

Hello to all.

I have made enquires of Kenwood in the UK regarding upgraded firmware for the UK model.

Replies are below.

> Greetings Simon - we spoke the other day about the cost of upgrading the TNC
> chip in your TH-D7E. I've checked with our Service department and the work
> involved would take about 2 hours, which covers replacing the 100-pin TNC IC
> and also re-programming another IC "in situ" for the 1200/9600 switching.
> In addition to this, there is the cost of the TNC itself.
>
> I'm told that the TNC is £35 plus vat and the labour element is £45 plus
> vat.
>
> Best wishes
>
> David Wilkins
> G5HY
> Communications Division

I then sent some of the posts from this group to David who replied thus

> Hello Simon and good to hear from you again. OK on the TH-D7AG. This is a
> development in the USA on their TH-D7A - roughly parallel to the one that we
> had recently here in Europe on our TH-D7E. Whereas in Europe our Version 2

> upgrade was more concerned with KISS mode, the American one addressed
> different issues and focussed more on GPS/weather-related issues. The two
> upgrades are not cross-compatible, however aspects such as the 9600 baud
> feature are indeed common.

I think that we have slightly different expectations of the mods.

Anyway, that's all the info I have.

Simon

But an HT which draws 4 amps on transmit and only 1/100 th of that amount
on receive ain't never gonna operate off of a 50 ma wall "charger".

What HT draws 4 amps on transmit? The TH-D7A is only spec'd at 1.6 Amps on
high power.

4 amps at 12 Volts is 48 Watts. Let's say our efficiency is just 25%. That
would mean that power out would be 12 Watts. Quite a bit more than the 5 or
so the TH-D7A puts out.

The extra heat dissipation would ensure short transmissions when using the
radio as a handy-talkie, tho! Almost the same scale as holding on to a
60-watt lightbulb, then turning it on. There's your humorous thought for
the night.

Now, off to the Seaside (OR) hamfest,

I must apologize for a statement made yesterday regarding my communications
with Kenwood. I was frustrated and couldn't get the information I wanted.
I made it sound as if Kenwood didn't even attempt to contact me and that was
not the case. Again, I apologize for any misconceptions that I may have
presented.

Hi all,

Robin R. wrote:

>... the rubber light button pulled out. Has anyone else had this prob-
>lem?

     On mine, the one that controls squelch (the bottom one) tore off.
I've found that by inserting the screwdriver on my trusty Swiss Army
Knife, it'll short the contacts sufficiently to let the D7a think the
button has been pressed. I suppose any appropriately sized piece of
metal would do the trick. But this does compromise the water-resistance
of the unit.   73

Wow 10 people on SUNSAT tonight. 80% of them mobile!

I found out how to stop the crashing of APRStk Ver K11 so that it can run
reliably and keep everyone's mobile rigs updated on the schedule and
presence of the satellites:

* I edited my CONFIG.SYS down from 30 FILES to 10, and 20 BUFFERS to 10

And now APRStk V11 has run reliably for over 36 hours and still running
(compared to 6 before). Thus, it just needed more memory.

To see how APRStk runining on a single 286 or better PC in your area can

update the front panel displays of all Kenwood APRS radios on 144.39 to
inform users of satellites in view or to be in view in next 80
minutes see...

You beat me to it. I copied one more: N9IDH, and I noticed that 70% were
D700's. I was using APRSdos, QWF using WinAPRS, ZNL using? and VBZ using
a NMEA tracker.

My first time practicing with real APRS instead of just the mobile rig.
ANd I was keeping up with all 10 of you. I had outgoing messages to
everyone... BUT!!! I forgot to set my path to SUNSAT until the very end,
so none of you saw it! Wow, practice... practice... practice...
Cant wait till FD!   de WB4APR, Bob

Rendered body type: text/plain

Anyone know if it's possible or impossible to shorten the D7's TX interval?

The manual says the quickest is .5 minutes.

For a foot race, I'd like to use 7 to 10 seconds -- makes for an active
screen to those in the audience watching the race progress.

Ralph, KC2RLM

Rendered body type: text/plain

The new "G" model upgrade lets the transmit rate go down to 10 seconds I
believe. The original D7 software doesn't allow less than 30 seconds unless
you control the D7 from a computer. And unless you have a wearable computer
while in the race, it would be kind of impractical! :-)

Rendered body type: text/plain

I'm waiting a couple weeks for the G model to show up at Burghhardt, but
then want to buy one. I have a few questions.

1. My D700 is in the car in the parking lot. What alias does one set so
that the car will digi to and from the handi? (Settings for both please).

2. I've seen many complaints about the poor performance of the supplied
ducky ant. What would you recommend as a replacement? (and who carries
it/price?) Having never seen the factory one, (except for a quick moment),
I think I recall it using an SMA or some such special connector. Size is not
an issue (within reason), performance is. If I find myself in a space
crunch, I'll use the factory supplied antenna.

3. Any caveat emptors out there? Things I should be VERY careful with as I
use the radio?

4. I'm strongly considering getting the MAHA charger and an FB 39 or 39
battery. Any feedback on these (maha charger and maha batteries)? Any other
recommendations for extra batteries and a charger?

....and no...I don't expect the Wall Wart to both run the radio and charge
the battery <vbg>

TIA

Just set the car up as a "RELAY." And use that as your first path. Or, put your call in the ALIAS spot and use your call as the first hop from the D7A. Just like you would any other digipeater. If your mobile is N0AN-1, then set N0AN-1 as the My Alias and have N0AN-1 as the first hop in the digi path on the D7A.

The factory antenna ain't great. I have a Comet high gain antenna. It's about 15 inches long and semi flexible. It works much better but it's also very ungangly! But if you don't care about the size, then it's nice. I think it was about $25. The SMA is the correct connector.

> 3. Any caveat emptors out there? Things I should be VERY careful with as I

If you plan to run mobile, get the Kenwood mobile adapter.

>

I have the Kenwood charger and it works good and the radio fits in real nice. A friend has the W&W charger and the radio doesn't fit in so good.

Many of the battery companies built their batteries wrong for the low voltage (6 Volt), high capacity packs. Their is a seperate spot on the back of the battery for the low voltage charging. None of the after market suppliers that I have seen used this correctly. They charge both the 6 Volt and the 9 Volt packs through the same pin. Kenwood's charger uses different pins for either 6 volt or 9 volt charging. So if you buy a 6 volt, 1800 mAH pack, you won't be able to charge it in Kenwood's charger (unless the battery companies have since corrected their error).
>

I wouldn't set the car as relay, you might set it as "car" though. This
keeps it from being used by anyone in the area with relay in their path.
(probably not what you were after)
Using the callsign explicitly works, but it's longer .

It's a great little rig, once you get rid of that 'dummy load' antenna.
:)

The second part of his question was about two way transmission of packets
through his car. If he set the car to "car" then only his D7 packets go out,
He will hear nothing unless the other stations use "car" in their path
also. Am I missing something here?

Rendered body type: text/plain

That's correct. But do you "need" the car to retransmit everyone else's
stuff? I would assume that there is a digipeater nearby that would be
copyable on the HT, but yet you might not be able to reach it with just the
HT.

If you want the TM-D700 to transmit any packet it happens to hear, then you
need to set it up as a cross-band repeater (just like you would for voice).
Transmit from UHF on the TH-D7A like normal (with a normal RELAY,WIDEn-n
path or whatever) and have the TM-D700 set up as a cross-band repeater.
Then anything it hears on UHF will be transmitted on VHF and vice versa.
That would be the way to really do it.

And with the remote control features of the TM-D700A and the TH-D7A, you
could turn the x-band repeater on and off at will.

The only other way to do it would be to make the TM-D700A into a WIDE and
that probably wouldn't be too good an idea to do.

No, relay-like stations only give you a bigger mouth.
Nobody should use wide,relay as a path, but you could use wide,car since
there won't be a lot of stations called "car". Using the car callsign is
ok too, and makes the target very specific.

The ultimate solution would be a crossband digi, acting as a wide, with the
HT on 440. This would eat up an expensive mobile radio though, so it's not
for everyone.

I've done it, but only in fringe areas. It works fine, using a KPC-3 with
substitution turned on and a TM-V7. You need to remember to turn it off
before heading back to civilization though, and you definitely need a
"cheat sheet" to hit all the commands right.

Jon,

Now that we have a good tread going, more questions for the group.

Quite a few hams around here have D700 and D7's. When we travel outside of our RF zone (Bloomington In.) we want to send messages back to our buddies using APRS messaging. We have a local Igate K9IU-10 that is connected to the Miami server and lets say the remote ham is in a city that has an Igate connected to the Miami server also.

What is the procedure for messaging to work between the two hams? what is the path for this to work? I have my D7 on right now WB9TLH-7 if you want to try to send me a message using Igate.

Dwight

That's correct. I think that when someone wants to send and receive APRS from a D7 using a D700 out in the parking lot as a repeater, that the crossband repeater function makes more sense than the digipeater fuction. It'll take your D700 off the network, but does it really need to be on the network while you are away from it?

Your D7 will still receive messages addressed to your D700's SSID, it just won't ack them.

(Caveat Implementor: I don't have a D700 so I can't confirm that 1200 baud afsk will pass the crossband repeater function unharmed.   I've heard some real bad things about the crossband repeater.   It sure ought to work, though...)

Rendered body type: text/plain

Please pardon the Newbie questions. I have the TH-D7a and am concerned about
the battery. Is there any way to get a NiMH? (I think that is how you say
the Hydride kind.) Also I have the car adapter, does it hurt the battery to
plug the unit into the car when operating? (I know you should deplete the
battery before you charge it. That is why I ask. I want to know if it will
give it a memory if I run from the car adaptor.)

Thanks,
Jon KC□GYI

You may want to try having the car relaying your ht via a non-relay/non-wide
callsign. You may be able to pick up stations as well as the car. Otherwise

cross-band repeat may work.

I use a Pryme RD-98. It is thin wire antenna and works good.

> 3. Any caveat emptors out there? Things I should be VERY careful with as I
> use the radio?

Do not drop it head first so that the sma connector or encoder knob hits the
floor. The encoder knob is the weak link of the radio, followed by the sma
connector. I managed to break mine and found out alot of people had broken
or bent those connectors/knobs. I sent the D7A off today to be fixed and to
be upgraded. I expect the unit back in August or September due to the upgrade
flood. I would fix it myself except I did not want to figure out
where the .1 uf chip capacitor I found floating loose inside the radio goes.

> 4. I'm strongly considering getting the MAHA charger and an FB 39 or 39
> battery. Any feedback on these (maha charger and maha batteries)? Any other
> recommendations for extra batteries and a charger?

I have the standard NiCad pack and a NiMH pack. I used a Radio Shack charger
that looks like the MAHA one. It does NiCad and NiMH and has adjustable
contacts. I have no problem using it. I am really starting to like NiMH
batteries. I am also glad I bought those Sanyo 1600 mAH AA cells at 2 bucks
each at Rochester, NH instead of the at 3 to 5 bucks each price at Dayton.
Everyone seemed to be selling 1400 mAH AA cells for a buck each at Dayton but
I would rather use the 1600 mAH cells.

> on the D7A.

  No Jon, that won't work ... you have to have it respond to WIDE so
that stuff from the network gets digi-ed into the D7. The RELAY part
of the path will have been longago used up by the time anything beyond
very local get sto the D700 to be digi-ed. I set my my Program 3
toposit every 20 minutes on medium power, digi on, uidigi as
relay,wide,trace for when I am parked at school and have my D7 on
inside. When I am back out on the road my Program 1 shust down the
digi runs the power back to high, and posits every two minutes.

Rendered body type: text/plain

Today I drove to the Kenwood Service Center in Cerritos and left my TH-D7 for the firmware upgrade. As reported before, the cost is $60, no checks accepted, but credit cards are. The receptionist said it should be done in 5 to 7 working days.

I also left my TM-D700. Problems developed with the cable between the control head and the main body of the unit. I replaced the connectors on both ends of the cable. I wired the cable straight through (black-white-shield-red, contacts down, cable coming out towards me) and verified it with a Microscan cable tester. I don't know if this is correct, but this is the way it appears to have been wired originally. The TM-D700 can no longer be powered up, so I left it with Kenwood as well. (No one was there who could tell me the correct wiring of the cable.) I push the reset button several times, to no avail, and I did verify that power was getting past the fuse in the wire that comes directly out of the base unit. I have to find the receipt for the unit (despite the fact that the TM-D700 has a one year warranty and only went on sale late last fall) and show it to Kenwood or I'll have to pay $50/hour plus parts for any repairs.

(By the way, my Extra Class license came in the mail today, so it looks like the FCC is getting through its backlog of those of us who passed the old Element 4B before April 15 and applied for the upgrade on April 15.)

I bought one from W&W Manufacturing in Hicksville NY at a Hamfest.
http://wwassociates.com

I believe Maha also makes one http://www.maha-comm.com

W&W make a fine NiMH battery. I took one on my sojourn down the
Unalakleet river in Alaska last summer and worked every satellite
pass of AO-27 for 10 days on one charge.

This may start a discussion but in my view the NiCD "memory"
phenomenon is a bit on an "Old Husbands' Tale" the biggest
documented problem is drying out from over charging. I use
my auto adapter all the time no problems so far. I use both the
original battery and the W&W interchangeably with no issues
so far.

Hope this helps 73 Jerry KK5YY

When in the office, the ONLY signal I will ever hear will be the D700 in the
car. The building is metal, and the nearest digi can just be worked from the
parking lot.

It is probably much more important that I hear the "network", than actually
transmit to it...although it would be nice.

Thanks to all for the fine discussion....I hope it continues to some
resolution and I will be following it closely. I'll do a separate posting
about accessories sometime today (recommended accessories). 73

A different way to connect power would be get a dry cell case for radio make
a battery elimnator like cell phone use might have to drop the voltage some
12 v to 9.6 say but will work without the worry over battery memory problems
I work rescue and use a similar setup for my radio to a power pocket supply
on long calls

have fun

My apolgies if this has already been mentioned, I haven't had a chance to
keep up on the sig for a few days.

For those of you looking for the G version manual supplement, it is
available at the Kenwood website. But, the English version is in Spanish.
So, on a whim I checked the Spanish version...its in English.

Rendered body type: text/plain

Hello all!

RE: the OEM-supplied rubber antenna ---
I am gratified to see that others agree with my opinion of Kenwood's supplied antenna (that it is a very poor performer). After working out a procedure of using the MFJ-259B antenna analyzer to "test" the relative tuning of any rubber-duck antenna (that is, determining its 50 ohm resonance vs. tuning), and testing literally dozens of BNC terminated and SMA terminated rubber antennas, I find that the OEM-antenna supplied with the YAESU VX5R (without using the 6m top coil, just the small end-cap) is the BEST PERFORMER (as a reasonable-length pocket antenna). One can purchase individual VX5R SMA-antenna(s) from Yaesu for $23.40 + shipping. Several of my friends who own D7's & G-71's have taken my advice and replaced their Kenwood antenna(s) with the VX5R antenna(s) and are VERY PLEASED with the results. BTW...the original Kenwood antenna shows its 50 ohm resonance at 160-162 MHz. --- the Yaesu VX5R antenna shows its 50 ohm resonance at 146.5 +/-, 1.2/1 VSWR (or less) across 144-148 MHz..

RE: a source for 2.5mm male 'stereo' plugs (for the GPS I/O port, or the computer port) for the D7 ---
Go to www.surplussales.com : order part (CNA)2.5MMSP - $1.95 each (or 1.75 each for 10-24 pieces)
These folks also have a BIG VARIETY of SMA connectors for direct-cable attachment, and all sorts of SMA-to-whatever adapters

RE: battery chargers --
I sure do like my MAHA MH-C777 universal charger..."smart" charging, battery-conditioning, good price. Also, MAHA's after-market NiMH packs for the G71/D7 series are good performers.

LASTLY --- collective opinion(s) wanted (WB4APR, your thoughts too PLEASE) ---
I am using a PACKET PATH statement on my D7 as "RELAY, WIDE, TRACE" ---- and I seem to be able to maintain accessibility in most parts of the country. The question is "Is there a 'preferred' universal statement to be used to maximize the process, while minimizing the 'bandwidth', or a series of different statements to be used under different APRS-conditions?"

Rendered body type: text/plain

I am looking for various ways to mount the control head without placing it
on top of the dash.

My vehicle is a Dodge Durango with a control head for my Yaesu FT-100
mounted on a flexible stalk at the front edge of the console. The base of
the stalk is mounted in the center cup holder at the base of the console.

Any suggestions?

73,

John, K4Yk

Message-ID: <LYR845-88645-2000.06.04-18.51.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

John,
    Too bad you don't have the FT-100 complete unit mounted where you can
see it, as the D700 display mounts under the Yaesu perfectly with two L
brackets. The National brand 1½" x 5/8" Corner Braces #N113-134 V115 are
just about a perfect fit thru the gap presented by the fold down feet of the
FT-100. Their thickness is just perfect and a little width must be removed
for a slide fit. A ¼" thickness of wood spacer stuck to the bottom of the
Yaesu keeps the braces and therefore the feet from flipping back. I then
removed the part of the D700 bracket that isn't needed and bridged between
the two braces with some light gauge aluminum to which the necessary dual
band bracket can be affixed. The best part of the installation is the fact
that the complete assembly can be slipped from the FT-100 so that the Yaesu
(mounted on Gamber Johnson slide mount), can be moved to other locations. By
the way, all of my radios are installed with the GJ mounts; which makes
things much nicer to swap between vehicles. I even have the vehicle mounts
in the shack, so that any unit can be taken there also.

Mouser sells the cables for the D7/D700..

http://www.pfranc.com   (purple computing) sells the Garmin
Connector. It is a very nice connector.

Also, I sell pre-made cables for use with Garmin GPS units and the
Kenwood D7 and D700.. My cables have power as an option, and now,
(new) a cigarette plug on the end of the power cable..

Packet Radio Affectionados,

   We have had packet radio for 22 years and yet we are seeing a decline
of digital operations on HAM radio (with some exceptions) at the same time
that we are seeing an Explosion of Wireless digital applications in the
consumer market.

We are not doing a good job of promoting nor explaining what digital
is all about. The following message I received says it all...

> 26 May, 2000
> From: [not published, but with permission]
> Bob,
>
> I really enjoyed your Op-Ed published in June's QST "Going Digital".
> I'm one of those hams who knows nothing about TNCs and how to use them.
> I've been searching the Internet and asking around and have yet to find
> a comprehensive source for information on it. All I want to do is
> connect my computer to my HT and connect to other hams doing the same.
>
> The lack of information seems to be pervasive. I'm a member of a newly
> formed club of hams working at Microsoft in Redmond, WA and when I
> suggested that a monthly meeting be dedicated to a demonstration of
> packet radio, we found that nobody in our 80 member club had either the
> equipment or the knowledge to present the topic....
> Sincerely
> [name on file]

If HAMS at Microsoft are not familiar with Packet Radio, then it is easy
to see why we are where we are today with amateur packet radio... With
all the world going digital and Now that Kenwood and ALinco are making
off-the-shelf 9600 baud systems, AMATEUR PACKET RADIO IS ONLY BEGINNING!
Lets reach out....

After talking to the sales manager at Kenwood Aust, I have decided not to
persue the above with them.

Although I am extremely disappointed, I will make a attempt in getting radio
to Japan or the States for upgrade.

If anyone can find out a email contact for Kenwood Japan I would be
appreciated.

Dennis

I run APRS+SA 9.22 with a KPC-3+ 8.3 and have not yet
experienced that error.
I have however, continually get a PARSE ERROR from certain

packets...

Questions:
Do you get any kind of message box indicating an error?

Does the TNC seem to be receiving and transmitting any relay
packets?

Does the TNC Tab display any incoming packets?

Does the APRS+SA program appear locked or is it otherwise
normal?

Glenn, KG7IL in Renton, Washington

I think we are all a little dissapointed with Kenwood Australia on this issue. I am very dissapointed with Stewart Lowe's response in his email. I asked the question of the upgrade, was this a recall, was it a product defect refectifaction, and inquired if this was the case then taking the issue up with consumer affairs might have been a viable option. We now know that its a firmware upgrade thats not a fault, but a development of technology. And that it is a costly upgrade. I do however question the ability of the kenwood australia service department to fix any problems with equipment that they sell if any equipment specific products will not be purchased and a sorry not our problem response given?.

There was a comment that this is what gives amateur radio a bad name, i dont believe this is the case eihter, This is the sought of thing that is pulling the hobby back. When one of the BIG THREE world wide manafactures wont support a product, or wont provide assistance through its company to support a product, (since Kenwood Australia is part of the Kenwood Corporation worldwide). To help solve a problem or investigate ways to help consumers of its product we have to think if we are prepared to purchase products from that company again.

I think Kenwood Australia are being very short sighed, Kenwood produce more than amateur radio products. I know that I will never again purchase kenwood comercial communications equipment (i am in a position where millions of dollars worth of such items will now go elsewhere), kenwood radio and audio products or kenwood whitegoods. I will also pass this request onto friends and business associates and recomend that kenwood not even be considered as Im not confidant that they will be able to provide support and service, as their opinion appears to be "not our problem, tell someone who cares"

I think this is a sign of kenwoods attitude in australia. Kenwood have not advertised Amateur radio products in the marketplace for well over 3 years now. They have some of the most advanced and leading edge equipment in the marlet place. But I think Its their loss.

The TNC is receiving and transmitting received relay packets. The computer
is talking to the TNC but the TNC is not talking to the computer. All
parameters seem to be correct and it started happening out of the blue.
Suggestions are much appreciated.

I agree with your comments. The general lack of information is not limited
to packet, but is a nagging problem throughout the field. As an example, is
anyone satisfied with the APRS handbook distributed by ARRL? I find the
book to lack detail. There's a lot of nice information concerning various
software packages out there, but little else. The other ARRL books lack
detail also, or they provide specific detail on certain aspects of radio
operation without giving the subject an adequate overview. Most of them
repeat information that is already available in the ARRL handbook, but add
little. The only way to get sufficient detail is to research it yourself
and to join user groups such as this.

Several weeks ago, I sent a letter to QST which asked them to publish a
series of articles on each band. Each month, they could cover a specific
band, and discuss propogation, band plan, general usage, antennas, and other
technical details that are specific to that band. Their response indicated
that they considered the suggestion to be too difficult to implement.

If anyone finds a good reference book for packet, please let me know.

Two ARRL books, "Practical Packet Radio" and "APRS Tracks, Maps and Mobiles" are comprehensive books dealing with packet radio and APRS, respectively. Both books provide a lot of detailed information not found anywhere else. I can assure you that these books do NOT repeat information already available in the ARRL handbook. I know because I wrote both books from scratch and did not beg, borrow, or steal information from other author's works.

Rendered body type: text/plain

I think that its too little too late. We have had 9k6 packet for how many
years now? certainly more than 10 and yet still today manufacturers sell
1200bd products.

The biggest problem is that the majority of users want off the shelf
equipment at a bargain price and that manufacturers are not prepared to
commit resources to something that is a 'passing fad'. How long was it until
Kenwood came out with a APRS radio? They sat and waited to see if APRS would
catch on and then commited some resources to it. Not too many resources
either judging by the way in which the early models had problems.

In the UK we are seeing a resurgence in packet after a long period of
decline. This is main due to the RSGB's Data Communications Commitee. These
chaps are tasked with network planning for the whole country. By creating a
new sub-band plan for data they have been able to make the choked network
move quite a bit quicker than it did. Users are now coming back to the mode
as it works for them. Also, the rise in IP stations has helped as they are
more bandwidth efficient than the regular FBB type BBS's.

My point is that all these things should have been done a long time ago.
Rather than being done now. At some point we have to stop being a
grass-roots organisation and become a mega corp. MAybe then we can push the
hobby rather than drag it.

We have John Hansen and Byon Garrabrant working on a stand-alone message
keyboard for the D700. There are two approaches.

1) Generate TTones to duplicate the functions available on the Microphone
2) Generate radio control commands on the serial port to "load" the
message memories.

I know that the commands exist. But I remember seeing some message
traffic about it not being exactly straight-forward. If anyone has any
experience with using the Serial port to upload messages, please let us
konw of any "gotcha's you have run into..

I've finally decided to begin the migration to linux.
I have a server 300 miles away from me that is running RH6.1 and hasnt been
rebooted since february...

I'm going to start by migrating my "B" machine, the one that is connecting
me (on the "A" machine) to the internet via connection sharing (two nics)
and performing the igate functions.

To that end, I need to get current on APRS under Linux, and Igating under
Linux.

Can anyone help me out?

(But first I have to solve an annoying video problem that's holding up the
whole show)

56. [htaprs] Upgraded TH-D7A(G)

From: "Stan Slonkosky" <ke6zc@earthlink.net>
Date: Wed, 7 Jun 2000 15:43:49 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-89434-2000.06.07-17.44.51--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I left my TH-D7A at Kenwood on Friday afternoon and it was upgraded to a
TH-D7A(G) by Tuesday morning.

One of the new menu items is 2-O, Setting UTC Offset. When I first saw this,
I thought, good, Kenwood must have added a real time clock, but that seems
to be a wrong assumption on my part. What then is the purpose of the this
Time Zone setting?

During a Sunsat pass this morning (around 7 a.m. PDT), I thought I put the
D7 into 9600 bps mode. At least that's what the indicator said. I heard
several data bursts on 145.825 MHz, but decoded nothing. I was suprised to
see that when reset the frequency to 144.390 MHz, it started decoding data.
I switched it back to 1200 bps and it continued to decode data. This
afternoon, I switched it back to 9600 bps and it did not decode anything on
145.390, but when I went back to 1200 bps it did. I guess that this morning
the D7 was misbehaving, but that now it's working correctly.

All,

Thought you'd be interested to know that the turnaround, at least in the
Kenwood East service center is fast.

According to UPS, my D7 was delivered to Kenwood at 10:00 am Friday, and
according to Kenwood, it was shipped out to me yesterday (Tuesday). I
believe that's less than a two working day turnaround.

I know te TH-D7 accepts these serial commands easily, and I expect the
TM-D700 does too. The TH-D7 command is...
AMSG 00,KD6VYV-7,Text message goes here
The 00 tells the radio to enter the message as an outgoing message (any
other number such as AMSG 01 will READ the corresponding message. KD6VYV-7
is the station you wish to send to.
I don't own a TM-D700 so I can't tell you if the command is going to be the
same. Anyone want to give it a try (Remember you will need the return
character at the end if you are programing a Pic chip - chr(13)).I would
think that serial commands would be the way to go.

Same as the D700.. Your GPS is only receiving UTC with this offset you can program local time in your trx
and set the time in the trx by gps. In that case you have a total accurat clock...

62. [htaprs] D700 error in position string

From: "G.W. Hester" <waynewx@c2i2.com>
Date: Thu, 8 Jun 2000 5:14:12
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-89519-2000.06.08-05.30.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

My D700 is sending an erroneous position data string using the unproto of APK101. When this data is transmitted the lat, long are wrong. When the radio attaches APK101 to the string, the error occurs. Normal position data is fine. The error string occurs randomly. This error was discovered by using the AFilter programs error checking utility.

I have contacted Kenwood, but have not received a reply. Anyone else having this problem, I urge you to contact Kenwood.

Rendered body type: text/plain

The D700 does NOT send position strings with APK101, it uses the Mic-E format which does not have APK101 in the TO field. So who is transmitting position data with APK101? IGates. IGates take Mic-e/D7/D700 position strings and "reformulate" them. Contacting Kenwood will be of no use. It is not their fault. If you had posted an example of the problem packets, it might be possible to determine which program is munging the data. There is a quite simple fix for this problem that I have suggested to the APRSDEV group. But every IGate program needs to sign on to the idea.

YES! And we Already we have it started:

In any area where someone is running APRStk, any Kenwood HT or Mobile
within say 150 miles will see on its front panel, a "tiny web-page"
showing the location, range and bearing of any FM satellites currently in
view. AND once every 10 minutes they see a little "tiny web-page" showing
them what satellites will be in view in the next 80 minutes.

Further, anyone can send "tiny web-page" views of all kinds of information
to these radios from anywhere. ALready we display:

  1) The location, range and bearing of the last 40 APRS stns around you
  2) The location, range and bearing of all DIGIpeaters in range
  3) The local WEATHER including wind speed, direction, rain and temp
  4) ANY APRS bulletins
  5) Any APRS mail (think of this as Email)
  6) And you can send out REAL EMAIL from the radio to ANYWHERE
  7) Other data available on demand even in APRSdos:
     The locations of all the nearest Radio SHacks
     The locations of all the nearest HAM stores
     The locations of all the nearest NOAA WX Radio xmtrs and freqs
     The locations of all the nearest Nation WX service sites
     The locations of all the nearest wide area VOICE repeaters for
     THe locatiosn of all the past Aircraft CRASH sites (for SAR)
     COnversion of Interstate MILE-MARKER data to LAT/LONG for
          translation of MM position to MAP position
  8) The range bearing and distance to ANYTHING ON THE PLANET as long
     as someone transmits it. The nearest Gas station, Campground,
     anything (that is appropriate for HAM radio)...

Simply think of the Kenwood Radios as "TINY WEB-PAGE" viewers...
and then the "content" that you want to see can be anything you can stuff
onto the "TINY-WEB-PAGE" screen!

APRS includes a QUERY format so that any station anywhere, can query for
ANY data anywhere. If you think of APRS as a ham radio INFORMATION
RESOURCE that can display ANYTHING on the front panel of your radio, then
you begin to see the HAM RADIO parallel to the internet that I am talking
about..

de WB4APR, Bob

CAVEAT: Most of the above is in place. But there are not enough APRStk
servers, nor do we have in place all the local infor "SERVERS" that are
needed. But the APRS protocol can DO IT.... and the radios CAN DISPLAY
IT!

We need to start nailing down the QUERY formats. I'm thinking in terms of
the briefest possible formats because we will be entering them using the
TTone pad on the radios:

?RS   - for Radio shacks and/ratio stores
?CG   - for camp grounds
?PK   - for Parks
?GS   - for Gas stations
?NWS   - for the WX Serveice sites
?WX   - ALREADY will report the local WX
?CRASHES - for the nearest recorded Aircraft crash sites
?APRS?   - Already returns all surronunding APRS stations
?FOOD   - Neaarest fast food
etc...

We must guard against comercialism, but these are "resources" for the
traveler and I see no problem telling someone by ham radio where he can
find food! We do it by voice all the time...

We will probably have to figure this one out ourselves. See if you can
figure out a pattern of when this occurs. The UNPROTO TO address is
changed within the HT EVERY time a POSIT and then a MSG is transmitted.
It is very possible that this can get out of sequence.... If we can nail
down when this happens, then we can figure out how to avoid it...

Can you post sample packets of the problem? I have not observed the D700 using wrong unproto TO data, and perhaps I have completely missed this if it has been discussed on this sig. I have observed plenty of IGate munging of Mic-E data.   Can you please post sample packets of the problem.   This will greatly help in pinpointing the problem.

Brent

>Time Zone setting?

Maybe: since the GPS when connected provides UTC time, the offset would be a
way to give local time zone stamps on received packets. To make it *really*
useful there should be a clock inside the D7 which would continue to run even
in the absence of a live GPS feed. It would be nice if there was a time zone
setting for my KPC-3+ which can set it's clock to the received GPS data (but
only UTC).

I received this reply from Kenwood a while back. If you are in the US,
these should work

Jim
KM5BS

Dear Kenwood Customer:

Thank you for your e-mail. The TH-D7A (G) upgrade will be available in
6/2000
The cost is about $60.00 plus shipping back to you. Both Kenwood Service
Centers will perform the upgrade. Do not send your TH-D7A until you contact
us first for its availability.

SHIPPING INSTRUCTIONS

Kenwood Service Center West
13030 Alondra Blvd., #104
Cerritos, CA 90703-2257
562-483-8740 phone
562-483-8749 fax

++++++++++++++++++++++++++

Kenwood Service Center East
829 Lynnhaven Parkway, Suite 130

Virginia Beach, VA 23452
757-340-1702 phone
757-340-6809 fax

If you need further assistance, please e-mail us again.

Sincerely,
Kenwood Customer Care

Lumpy writes:
I assume, Bob, you are referring to the preloaded
files showing the Rat Shacks and other stuph
that reside on the 'client'.

I've been hoping to see a way to query for
live or at least 'server stored' data, which is
what I think you refer to below. Like Steve Scott's
QST server voice machine in Las Vegas.

I'd like travelers to be able to query for things
like -
Local recommended UI path
Local voice nets
etc.
I'd like to see the query trigger the transmission
of a txt file with the appropriate information.

> We need to start nailing down the QUERY formats...

I agree...lump

> ?RS   - for Radio shacks and/ratio stores

> ?WX   - ALREADY will report the local WX
How do we do this exactly, with a D7A, for example.
I can do it with a couple mouse clicks in WinAPRS,
but I don't know how to do it 'the long way'?

```

Sprouls and I talked about this back in 1995 and designed all the formats
in to APRS, and they were going to put it in WinAPRS. But they have been
so busy, the SERVER side of this has not happened yet.

But now that APRStk is serving Satellite data and APRSdos already has all
the data for the examples below, It should only take me a few hours to add
al this to APRStk...

TO answer your last question, no, right now, you can on ly QUERY other
stations with the D7 band D700. THis is a problem we must address. If I
add the SERVER stuff to APRStk, it will recognize the QUERY within a
MEssage...

SO much to do... so little time :-(

On the bottom of this link is a very home made diagram of the Kenwood
cigarette adapter. It has been suggested that what I thought was a
regulator is actually an inductor. Since I have used an unfiltered adapter
before, this makes sense. I do not think it needs to be regulated, just
cleaned up a bit.

Have not checked the voltage coming out....

Craig,

You can use the D700 in APRS mode with it's own built-in software for APRS
functions, or you can use the D700 in PACKET mode with external APRS
software, but not both.

With the D700 in APRS mode, you can still get data out of the radio via the

port, but it is not in a format readable by any current APRS software. To view this data, use a terminal program such as terminal.exe in Windows 3.1 or HyperTerminal in Win95/98, and the following steps:

1. Select the proper serial port with the terminal software
2. Set the communications parameters to 9600-8-N-1
3. Connect "Direct to COMx" (x being your selected port number)
4. When you connect to the radio, type AI 1 (letter A, letter I, space, number 1)

You should then see information coming back from the radio in Kenwood format. This shows a lot of information: volume and squelch settings, selected frequency when you change channels, APRS data in a comma-delimited format, messages in a comm-delimited format, etc. etc. I have some information on my web site on how to set some of the radio's parameters from the serial port: see http://www.netcom.com/~jimgill/tmd700a.htm . From there you'll find links to VK2TDS's page on further Kenwood Protocol information, and with this you can enter specific frequencies, etc.

The format of this Kenwood data is well known among the experienced D700/D7 experimenter-type users, so the capability exists to create a new program (or modify a current one) to be able to use the data from the radio in TNC APRS mode... the parsing routines just need to be written and incorporated into some software.   For now you'll have to do one or the other.

As far as the problem of keying the mic only clears the APRS data display, this is still a bug on the D700 that has been fixed on the new (G) firmware revision of the THD7 HT. Let's hope Kenwood offers a fix for the D700.

I suspect that the power filter sold by Radio Shack to suppress ignition noise in car stereos would probably work just fine.

After many frustrating experiences trying to use the radio controls to
format text messages for the D7 and D700, I've abandoned the APRS mode.
What we need is the ability to connect an external computer or PDA to the
radios without disturbing the APRS function. Software to filter, view,
manage and reply to APRS messages while the radio is in APRS mode is begged
for here. Using a PDA seems like a natural.

I suspected that it must be possible to get the serial port to do something
when in APRS mode. Maybe this can be fixed. How about it, any of you
programmers out there interested in taking this project on?

81. [htaprs] D7A Cig cable

From: "Hufford, Kent - ANG/C4" <Kent.Hufford@ngb.ang.af.mil>
Date: Fri, 9 Jun 2000 09:20:17 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-89727-2000.06.09-08.29.27--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Ignition noise has not been the problem in my D7, and a few others.

It has been voltage spikes making the D7 lose its mind, or go into some "state" that the only way to recover is a reset.

I've been using a car adapter from an old ICOM 24AT(that drowned in a flood). Works fine. Has a cap. and an inductor in it.

Hi all,

Got my upgraded D7 back yesterday, and it's great having all the new
features. Especially the ones which get rid of some of the annoying traits
the original unit had.

However, without a programming application, it's a pain to program. I've
contacted Kenwood about a software release, but they don't have an answer.

Does anyone know of a third party application, like Link7, which may be
available? Mr. Parise, if you're listening, are you going to modify your
great program to work with the upgraded radio?

73,

Howard

Howard,

I think I will wait to get my D7 upgraded, The programming software is very important to me. I hope the data file will transfer over from the old software in to the new. I have lots of frequencies programmed in, not that I use them all but I use the radio memories as a data bank.

85. [htaprs] Tiny-Web-Pages!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 9 Jun 2000 11:04:53 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-89748-2000.06.09-10.08.34--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Yesterday I mentioned the concept of "Tiny-Web-Pages" for supplying data
to the Kenwood D7 and D700 mobile and handheld front panels.

Stayed up most of the night and now we have APRSdata.exe.

THis is just another version of ARPSdos that only needs to run in
someone's shack in your area and serves up the following "Tiny-Web-Pages"
to mobiles or Handhelds in the area. No, this will NOT flood the network.
It is only one packet per request!

 1) Maintains a Sat Schedule for the next 80 mins on the radios DX list
 2) Sends out Satellite OBJects whenever one is in view. Showing you
    the uplink and downlinks frequencies, doppler and range to you.
 3) Responds to DATA queries with Tiny-Web-Pages for the radio's panel
    * DIGI will send you the nearest DIGI to you
    * WX   will send you the nearest WX (even if it was originally in

```
            raw PEET brothers format or was a WinAPRS positionless
            report...
    * NWS   The nearest National Weather Service site
    * NWR   The nearest NOAA WX radio site and its frequency
    * CRASH The nearest reported old Aircraft Crash site for SAR
    * HELP  A list of data bases available
    * RS    The nearest Radio Shack or Radio Store to you
    * XXXX  The nearest ANYTHING to you in the file XXXX
    * etc...

To send a Query from the D7 or D700 simply address your message to QDOS
(for Query DOS) and in the TEXT of the message, enter the data.
For Radio Shacks, simply send TO:QDOS     :RS

Notice that I purposefully made these as short as possible since these
queries will be hand entered on the TTone pad.  Remember, this is for
Mobiles and Handhelds.  ALl of this data already exists in all versions of
APRSdos, and presumably other APRS software, so there is no need for fixed
stations to be doing this.

You can even make up POS\*.POS files for anything else.  GAS, FOOD, HOTEL,
etc.  And you can manage the data locally.  All you need are lists of the
LAT/LONGS of any objects you want to provide as "TINY-WEB-PAGES".

To set up an APRSdata engine in your area:

1) Download ftp://tapr.org/aprssig/dosstuff/APRSdos/adat-exe.zip
2) Install it in your existing APRSdos directory using PKUNZIP -D
3) Follow SETUP instructions in README\APRSdata.txt on how to load,
   and rename your existing POS\*.XXX files to the correct name.
4) ALso read APRStk.txt from which this program was derived.
5) Run it as you would your normal version of APRSdos.
6) Be CERTAIN that your DATE, TIME, ZONE and DAYLIGHT SAVINGS time
   are set correctly.  BAD satellite data is WORSE than no data!
7) COORDINATE with any other APRSdata servers to make sure that
   we do not have overlaping coverage:
   a) Set your outgoing path to serve a specific local area, no further.
   c) Set your CFL limit to ignrore Queris more than X hops away

NOTE: APRSdata.exe REPLACES APRStk for the purposes of supplying satelite
tracking data to your local area.  APRStk from this point on will not
do this function, but will conventrate only on automated Satellite
ops using the Kenwood radios...  APRStk  has NOT been updated and
the last good one was Version K10.  Trying to re-engineer it to
do the new upside-down SUNSAT mode just became too hard andto big,
so I decided to spin-off this SERVER function to a separate program..

CAUTION!  The format used for these OBJECTS is semi-compatible with the
old D7.  THe OLD D7 will capture the OBJECT, but it will be LISTED under
the callsign of the APRSDATA.EXE SYSOP.  But the DATA will be correct.

de WB4APR, Bob

As I posted details about this earlier, I won't repeat, but... My D700
continues to issue position strings literally all over the map. Every time
I do a route trace, I get one accurate route trace, plus 2 to 3 erroneous
traces going of 1,000 miles.

Are you sure the "bad" posits heard are from the D700 direct? Could a
bad MIC-E decode routine in a local digi be creating your errant posits?

Brian,

I don't think so. Other mobiles in my neighborhood track just fine. Also, these errant tracks are painted even when I am being tracked 50 miles away from my QTH. I consistently am painting one perfecrt track, and 2 to 3 erroneuos ones. The erroneous ones go out over a 1,000 miles.

Larry

BTW - I have 2 of the D700's. They both do this. They are both less than 3 weeks old.

You need to give much more info than that.

What was the path?
Did it go through any smart digis?
what map?
What software are you using?
Did it go througgh the internet?
Are you viewing it off the air or via APRServe etc.

People can help, but we need real data..

You have not proven it is the D700.   I'm not saying it is not the D700, but you have not proven it is the D700. The fact that non-D700 trackers track OK is irrelevant.   You are not comparing the same thing. Perhaps you should compare APRSdos tracking the D700 to WinAPRS. You would then be looking at the software variable. If one D700 is tracked incorrectly by the monitoring software, the I'd suspect all D700s to exhibit this problem. Is that not what you just said?   I have a D700. It tracks fine. But I'm using different software to do the tracking.

Bob,

Outstanding!!

Just by way of clarification, for folks with a D700, if you want to do the
Radio Shack querry...

In the MSG mode on the D700, would you enter QDOS where it says "Call Sign"
and then in the text field simply type RS or would you need to type
TO:QDOS:RS in the text field?

Thanks for staying up all night! We will return the favor!

Have you specifically checked these errant posits to see if they are being
sent by a digi decoding your MIC-E sentence and reencoding it? That is most
likely the problem.

If you really want help on this, you need to capture a log of all of your
posits, and post some of the errored posits for analysis.

I HAVE NEVER SEEN THIS BUG!

In fact, I try it all the time. If I have a packet that came in and shows
up on the data band side of the screen, I can key the mic and talk just
fine. The only time I can't do that is when I specifically go and bring up
the list of stations to look at a specific station.

I have one of the first D700s and it behaves NOTHING like the bug in the
original TH-D7A.

The D700 program does NOT work. It says, INVALID RADIO.

You guys with PCs to program the radios are lucky. Don't complain.

I use the Mac platform. No one writes TH-D7A or TM-D700A software for it.
I've always had to manually program the radio.

Of course, I would rather manually program the radio than put up with
Windows! I use Windows at work and that is all I can stand!

I've been a Mac owner/user since 1984. I have had many Macs, both at
work and at home. I love'em. But diatribe like this gets old pretty
quick. It certainly doesn't get more people to write software for the
Mac. About all comments like these do is give Mac users a bad name.

Does the QDOS system send out a POSIT periodically? This would make it
easier for a user to simply scroll to QDOS in the posits list and hit MSG.

So the question is this: Does anyone have a D700 that tracks properly with win APRS 2.4.5?

Larry

>
>Larry

You have not proven it is the D700. I'm not saying it is not the D700, but
you have not proven it is the D700. The fact that non-D700 trackers track
OK is irrelevant. You are not comparing the same thing. Perhaps you
should compare APRSdos tracking the D700 to WinAPRS. You would then be
looking at the software variable. If one D700 is tracked incorrectly by the
monitoring software, the I'd suspect all D700s to exhibit this problem. Is
that not what you just said? I have a D700. It tracks fine. But I'm
using different software to do the tracking.

I've been following this thread for a while. I have D700 and am running 2.4.6. I _have_ seen something like this with my tracks occasionally. I never really thought about it before. I always assumed that the erroneous info was sent by the D700 right after powering up and before getting data from the GPS. Or that it was scrambled when I started the truck. I'll try and pay more attention.

One thing I have noticed about WinAPRS. (Not throwing a rock here... it's the program I use the most. If I'm right in my analysis, any program would do this.)

Sometimes I see a station get data mixed from another station. Maybe the icon will change for a while, or it will turn into a weather station. I've even seen call signs get changed. I believe that this is the result of packet collisions, and the TNC decoding pieces of two different packets as one. I don't recall if there is a CRC sent to keep this from happening, but even if there is, it wouldn't be foolproof.

73,

Chris KD6DSI

Are you listening via net, or RF or both?

I see a lot of old data on the net, up to 20+ minutes old. Makes a mess of
tracking.
This latest version of WAPRS helped a lot, but didn't eliminate it.

Yes/no. THeir CALLSIGN will be just the call of whoever is running the
software. You can find them in APRSdos by looking at the DIGIPATH
list and then doing a JUST "APRD" and you can find them as they will have
the version number of APRDA0. But I suspect it will be many days before
you start seeing any of them on line...

Hi Dave

I should have included that I am strictly talking about tracking my vehicle
with a D700/Rand McNally gps via RF on my home station running winaprs
2.4.7. Probably most of the packets would be direct or via my WIDE.

I keep the HamHudII for the motorcycle!

I asked, because the inet delayed packets aren't just a hamhud issue.
That's just where I really noticed them, since the HH does such a nice job
at tracking.
They look great on RF.

Chris,
  I too have a D700, but have not seen the erroneous positions reported. Of course, I haven't been looking either.

I work with several commercial AVL applications that receive wildly erroneous location information on occasion. These applications do not use APRS formats, protocols, or any APRS applications yet they experience these same errors.
  The mobile devices are made by several different manufacturers, and use different communications methods and protocols. The only common element is the GPS.

I suspect that in addition to errors created in the mobile device, errors are being created by IGATES or other applications that convert Mic-E, or compessed locations to another format and pass the modified packet to the Internet feed.
 Each application that converts location formats must usually convert the received location to DD.DDDD and then convert this to DDMM.MM for further transmission. The enduser application must usually convert this format back to DD.DDDD for internal use. The end user application then must convert DD.DDDD to integer values that can be used to display an icon on a map display. Each one of these conversions can introduce rounding errors and in some cases, wildly erroneous locations.

I don't think that mixed packets are generated by TNC's. Yes, it could happen but is most unlikely. The one case that I am familiar with involved an IGATE that mixed some packets obtained locally with packets of a station that was in his stations.txt file. This IGATED station was located several thousand miles from the IGATE. The mixing was noted on numerous occaisons and always involved the same 2 stations. The IGATE TNC had MStamp on, and was passing timestamps in the header. Once the IGATE operator turned MStamp off, no further mixing of these two stations was reported. It is likely that the IGATE or a downstream application was mangling the packets but this appeared to clear up after MStamp was turned off at the IGATE.

The only packets, to my knowledge, on the Internet Feed that contain error checking are GPS NMEA strings. I hope that there are no applications that do not verify checksums and use whatever NMEA data is provided, even with a bad checksum. $GPRMC strings include a field to indicate if the location data is valid or invalid. I hope that no applications ignore this field, and plot the locations even if marked invalid.

CRC checking of every packet would increase the integrity of the data.
 Unfortunately this is not provided for in the protocol at present. We have error checking on the RF link, but none on the Internet feed, or at the application level (NMEA strings excepted).

Jon, you have said this before; I still must disagree ... my D700
(bought around March 4st from HRO Salem, NH) will only clear the
screen when a data item is still on the screen. I had it happen only
an hour ago. I launched into a long winded reply to a buddy of mine
and was waiting for his reply only to hear him come on and ask if I
was still around!!!

This is the same problem, you key the Mic the transmitter comes on put no
audio that I asked about two months ago. Kenwood never replied.. It seems to
have something to do with what radio you have the tnc running on .

I'm sorry, this message might be somewhat long. Refers to D700 and Igate
packet reformulation. This is the data some have been asking for. Delete if
unwanted.

----- Original Message -----

feed.

Yes, that is what I have seen with recent WinAPRS versions converting D700's when I'm on both RF and TCPIP. I definitely see the "Spirograph" track plot in WinAPRS in this situation. It appears that my IGate immediately sends the "translated" packet to the APRServe stream, then either my same station, or another on TCPIP, re-converts or re-gurgitates this packet again at a much later time... as much as 10-20 minutes later as Dave VanHorn has observed.

There must be more than one application on the TCP feed "trying" to be "helpful" in converting this data, or WinAPRS must send it out in different formats, for the TOCALLs of the following packets seem to indicate more than one conversion is taking place, even well after the original packet was heard on RF. Notice the different TOCALLs and VIAs:

T1QQ4T The original D700 packet on air
APK101 The converted packet, sent to TCP by my WinAPRS (I think 246 at the time) Igate
APRS Another conversion, by me or someone else? Note slightly different trailing decimals
APK,APS Is this my Igate again, or some other version?

Also notice the "interleaved" position reports - drill down to see it. You'll see the first position repeated almost 20 minutes later way down at the end - the vehicle was NOT there again at that time. This capture was taken real-time right from the history list for this station as the data was coming in and the vehicle was driving on a "normal" in-town trip. My WinAPRS was RF and an Igate at the time. This is not the mobile's fault, but the "translation" routines.

I have one of the first few D700's that arrived in the US. It too has the
bug.

When using voice on 2m on the "A" band when the APRS TNC is active on the
"B" band (also 2m), if certain APRS data is displayed, pressing the PTT
simply clears that data but does not activate the transmitter. As others
have pointed out, this is quite annoying when you don't realize that
you're not transmitting when you think you are!

Hi all.

Well, in a couple of hours I will be headed for Bean Town. I arrive late
tonite and will be heading directly to Hyannis Port where I will be until
Sunday afternoon.

I'll then be heading to Boston and staying there at the Marriot until
Thursday. My TH-D7A is coming with me as well as my VC-H1. So if there is
anyone who wants to trade video, shoot me a message when you see my icon.

Well, then Kenwood must have changed the software or something. Because
after you mentioned it, I specifically went and tried to make it happen.
I've never had it happen. In fact, if you go back and look in the archives
on the report I wrote when I first got the radio back in late December that
one comment I made was that they fixed that bug. Believe me, I've tried to
make it happen multiple times. It doesn't.

And I haven't heard many others complain either.

I've never seen it and I also have one of the first radios. I think we got
ours just about the same time, Julian.

It's not a diatribe. It's the truth. What's wrong with saying that you
prefer one platform over another even if it lacks software you'd like to
have? Honestly, one Windows machine is all I can stand. And I am even a
Microsoft stock owner!

Rendered body type: text/plain

Three versions today. THis last one forces NORMAL mode since we still
have some softwares that do not properly decode the compressed format.
The first versions of APRSdata sent out the objects compressed and users
were reporting problems.

The latest will UNZIP to version DA2.

This is the only difference to DA1. But DA1 will revert to COMPRESSED
every time it starts... :-(

Bob

Rendered body type: text/plain

Jim,
  I've been looking thru the packets you provided in an attempt to identify
patterns that may give us an idea of what is happening to the D700 and other
packets.

The mixing of packets :
KD0XQ-5>T1QQ4S,K0BOY-1*,WIDE:'|\vlv/]"7k|'|\wlv/]"7k}Steve\Mobile_KD0XQ@ar
rl.net
This looks like a status packet that has the information from a position packet
inserted..
Note that the locations are different in each MicE location.
The next packet is a position packet that is similar to the embedded position
packet above
KD0XQ-5>T1QQ4S,K0BOY-1*,WIDE:'|\wl v/]"7V}

Here are packets that are timestamped the same, but all convey different
information. You need to look closely to see the difference between the first
and second packets.
KD0XQ-5>APK,APS:@041940z4111.00N/09602.57Wv315/010/TM-D7/M2/IN SERVICE]"7Y}
A=001112
KD0XQ-5>APRS,K0BOY-1*,WIDE/1:@041940z4111.00N/09602.57Wv315/009/E>dsy/M2/In
Service]"7Y}
KD0XQ-5>APRS,K0BOY-1*,WIDE:@041940z4111.45N/09604.28Wv270/034/E>dsy/M2/In Se
rvice]"7X}

The timestamps are inserted into the packet by the application converting the
packets. What are the chances of all of these applications having the same
exact system time? Lack of time synchronization may be creating the perception
that packets are arriving out of sequence. The sequence may be reasonable, but
a timestamp may not be. The same MicE packet could be placed on the Internet
feed by 3 different applications and each application could be supplying a
different timestamp. Or entirely different locations could be placed on the
Internet feed using the same exact timestamp.

The above example was edited slightly, by removing a single packet for clarity.
The actual packet received sequence was :
KD0XQ-5>APK,APS:@041940z4111.00N/09602.57Wv315/010/TM-D7/M2/IN SERVICE]"7Y}
A=001112
KD0XQ-5>APRS,K0BOY-1*,WIDE/1:@041940z4111.00N/09602.57Wv315/009/E>dsy/M2/In
Service]"7Y}
KD0XQ-5>APK101,K0BOY-1*,WIDE:@041939z4111.45N/09604.26Wv270/034/Mic-E/M2/In
Service>
KD0XQ-5>APRS,K0BOY-1*,WIDE:@041940z4111.45N/09604.28Wv270/034/E>dsy/M2/In
Service]"7X}

If seems plausible that several WIDES may be receiving the same packet but
inserting different timestamps during the conversion process.
 .

Rendered body type: text/plain

Jim,
  I decoded 3 MicE packets and looked for converted packets that matched
exactly.

KD0XQ-5>T1QQ4T,K0BOY-1*,WIDE:'|Zi "bv/]"7h}Steve\Mobile_KD0XQ@arrl.net
AFilter decoded the first MicE Packet as :
KD0XQ-5>T1QQ4T,K0BOY-1*,WIDE:'|Zi "bv/]"7h}Steve\Mobile_KD0XQ@arrl.net
 (4111.44N 09602.76W 270/40/In service)

The next 2 packets were close, but no exact match. This could be rounding
differences or different packets.
KD0XQ-5>APK101,K0BOY-1*,WIDE:@041937z4111.43N/09602.76Wv270/040/Mic-E/M2/In
Service>
KD0XQ-5>APRS,K0BOY-1*,WIDE:@041938z4111.44N/09602.77Wv270/040/E>dsy/M2/In
Service]"7h}Steve mobile_KD0XQ@arrl.net

KD0XQ-5>T1QQ4T,K0BOY-1*,WIDE:'|[am@bv/]"7e}
The second MicE Packet is decoded as :
KD0XQ-5>T1QQ4T,K0BOY-1*,WIDE:'|[am@bv/]"7e} (4111.44N 09603.69W 270/13/In
service)
KD0XQ-5>APK,APS:@041939z4110.85N/09602.46Wv003/012/TM-D7/M2/IN SERVICE]"7W}
A=001106
KD0XQ-5>APRS,K0BOY-1*,WIDE/1:@041939z4110.85N/09602.46Wv003/010/E>dsy/M2/In
Service]"7W}
Close but not a match.
KD0XQ-5>APK101,K0BOY-1*,WIDE:@041938z4111.43N/09603.68Wv270/013/Mic-E/M2/In
Service>

The following packet exactly matches the second MicE Packet decoded :
KD0XQ-5>APRS,K0BOY-1*,WIDE:@041939z4111.44N/09603.69Wv270/013/E>dsy/M2/In
Service]"7e}

KD0XQ-5>T1QQ4U,K0BOY-1*,WIDE:'|\8oJbv/]"7X}
The third MicE Packet is decoded as :
KD0XQ-5>T1QQ4U,K0BOY-1*,WIDE:'|\8oJbv/]"7X} (4111.45N 09604.28W 270/34/In
service)
KD0XQ-5>APK,APS:@041940z4111.00N/09602.57Wv315/010/TM-D7/M2/IN SERVICE]"7Y}
A=001112
KD0XQ-5>APRS,K0BOY-1*,WIDE/1:@041940z4111.00N/09602.57Wv315/009/E>dsy/M2/In
Service]"7Y}
Close but not a match
KD0XQ-5>APK101,K0BOY-1*,WIDE:@041939z4111.45N/09604.26Wv270/034/Mic-E/M2/In
Service>
The following packet exactly matches the third MicE Packet decoded :
KD0XQ-5>APRS,K0BOY-1*,WIDE:@041940z4111.45N/09604.28Wv270/034/E>dsy/M2/In
Service]"7X}

If 3 different applications convert locations differently, or assign different
timestamps, there is no way that APRServe can detect duplicate location packets
that originated from a single Mic-E packet. Each will be treated as a separate
and distinct location packet by APRServe, and the enduser application. If the
user attempts to display a track using the data in the example, the track will
likely contain as many as 3 locations for every MicE packet generated, and the
track may spiral or wander in random fashion. If packets are arriving out of
sequence or are delayed any length of time the spurious tracks may be greatly
exaggerated.

This is not the fault of the D700. This is a system issue involving the
integrity of the MicE location data. The cause appears to be iconsistant
conversion of the Mic-E data by IGATES.

Bill KC9XG

We had a similar but different problem in the banking industry.

Solved by implementing a "sequence number". Simply a single byte that is
incremented each time the terminal sends a transaction. In this case, same

callsign, same sequence, same packet. How you choose which to accept is
beyond me, but it would at least identify when there are dupes.

Three items:

1)   When you send a QDOS Query for DIGI it returns the nearest WX and
when you Query for WX, you get the nearest DIGI! ARGH! WIll fix Mon.

2) The REAL advantage of APRSdata is that now MOBILES and HT's can access
all of the remote WX sites that report only in raw PEET brothers format.
In the past, this data was not decoded directly by the radios.

3) The NEXT data file I want to add to my system is the CLUB file. In
the greater Wash/DC metro area, there are over 100 clubs! Just imagine
anytime, anywhere when you are driving around in another part of town and
have some time on your hands, you simply do a QDOS CLUB and back comes an
OBJECT showing you their location, meeting times and FREQUNECY!

ANyone want to take the AUTOCALL magazine and start building the CLUB file
for the Washington DC area??? (remember, you have to squeeze the freq and
times into only 20 characters for display on the THD7's "tiny-web-page"...
But it's easy!

```
+-----------+
| AARC      |
| 1st Thurs |
| 147.105   |
+-----------+
```

And remember that the Radio then computes the Direction and DISTANCE for
you individually!   You cannot even get that on the internet!

4) ANd to properly do the ZIP codes, remember to download the entire
zipped up zip code ZIP file and then pull out the ZIPS.xxx file just for
your area. These are BIG files, and so you only want the ZIPS for your
area only...

de lumpy:
For a 110v D7A supply, I use an old 12v 1.5a
laptop power supply. Same supply powers my
KPC3+ and my Alinco HT (@ 5w RF). They
all exist in harmony, plenty of current
for all, charges and doesn't seem to
damage the battery (maha 1300 mah).

Those kids with the gazillion db car
stereos use several hun-thousand mfd caps
in parallel across the 12volts that
powers their amps, theoretically
buffering the power and allowing
the traffic light annoyance factor
to be more balanced.

I usually put some capacitance across the
output of just about any power supply
just for fun. Not sure that I can note
any difference, but I'm probably not
creating the same kind of current draw
as those stereo amps.

If I knew more about hysteresis, I'd
probably hang a coil on them, as well.

Blasting a loud packet brrrraaappp at the
traffic lights on cruise night! Way cool!
Chick magnet!

The real problem with those big caps and it can be come a big problem
is the inrush current. Those huge caps look like a dead short for a
fraction of a second when power is first applied

New version fixes DIGI and WX reversal and adds FD and CLUB data. Of
course, you will need to edit these files for your area... Since I did
NOT have time to test it at all (I stole this time from Honey-dos) I
posted it as:

 ftp://tapr.org/aprssig/dosstuff/APRSdos/adatbeta.zip

ALso, I am trying in this version to just IGNORE errors and let the
program resume on its own... It will keep a running count of how often
this occurs.. You will get the Orange Screen of death, but it should
resume after 20 seconds...

Has anyone tried this via the radio control port of hte D700?

That is, turning on FULLDUPLEX while in APRS mode? If this CAN be done,
then a simple PIC "dangle" can be used to out the mobile into APRS
Satellite mode!

 On Sat, 10 Jun 2000, John Hansen wrote:

We have been back and forth on this, but it still remains to be proven.
Just seend the command to cnotrol the TNC, then issue the FULLD ON command
then exit command mode, and it "may"? "should"? work?

I konw the old D7 would RESET the TNC when you exited the TNC command mode
and so it would always restore the APRS values. But maybe the D700 wont?

Dont do it.

Someone asked about overlaping areas of coverage? ALthough we need to
manage this quite closely, it can actually be a benefit. Imagine a
station between CITY A and CITY B, both of them have an APRSdata running.

The user does a QDOS for the nearest FD site and back come two OBJECTS.
One is from the database of CITY A and the other is from a different
database of CITY B. Now our user is half way inbetween, yet he gets TWO
to chose from. One probably towards A and the other probably towards B.

Just a thought....

Message-ID: <LYR845-90063-2000.06.10-19.05.36--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For those of you without a D7, here is what some of these Tiny-Web-Pages
(TWP's) look like on the Handheld. The handheld displays the data on as
many as 5 sub-pages. The D700 mobile has a much larger front panel and
displays it all one one page. I will show only the small HT screen in
these examples... Fuzzy photos are on the following WEB page:

http://web.usna.navy.mil/~bruninga/satinfo.html

Set your Email to display FIXED FONT, 80 columns!
The first two examples are what APRSdata.exe "pushes" to all users on
the terrestrial APRS frequency. THe first one once a minute when a
satellite is in view. THe second once every 10 minutes to the DX LIST.

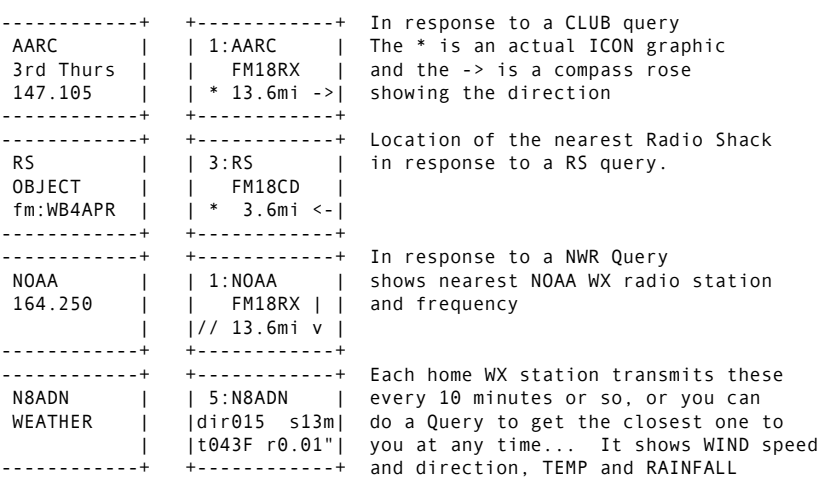
```
+------------+   +------------+  Satellite-in-view PAGE
| AO27       |   | 1:AO27     |  Showing Up and Down freqs plus doppler
| 145.85  -2 |   |   FM18RX   |  Showing Range and direction
| 435.795 +6 |   | * 1028mi ->|  Other page (not shown) shows CSE and SPD
+------------+   +------------+
```

When the satellite gets to within about 1000 miles, you can work it from
the mobile or the HT usually..

```
+------------+   Future PASS predicitions updated every 10 minutes
| UO22@1435  |   as listed in the D7's DX list showing all FM satellites
| SO35@1453  |   expected in the next 80 minutes
| UO14@1532  |
+------------+
```

The following examples show the type of information that can be delivered
to the TH-D7 handheld display in response to a Query. The first screen

is the "immediate" screen that summarizes the data the instant the packet comes in. It is displayed for 10 seconds. After that, it is stored in the STATION LIST along with the last such 40 items. Each such ITEM has actually 5 "Tiny-Web-Pages" of detail. Only the first two are shown here. THe others show exact LAT/LONG, and CSE/SPEED and other data..



Will this overload the APRS frequency? No. Each such query response is only a SINGLE 1 second packet. (Locally generated and managed.)

Home stations don't need it. ALL of this data is already built into every copy of APRS(dos), so anyone running at home already has access to this data on his screen. These TWP's are only for the mobile who does NOT have a running APRS laptop. THus it is a small number of users that will be requesting data at any time. Even during COMMUTER hours, less than 10% of all stations on the air are mobiles...

Oh the fun we will have building these TWP databases of AMATEUR RADIO RELATED or HAM TRAVELER data for users...!

Rendered body type: text/plain

I know you are getting tired of this, but one thing I left out of the TIny-Web-Page (TWP) examples are of course:

1) DX SPOTS. Both radios will capture and display DX SPOTS when tuned to a DX cluster frequency

2) APRS Stations. And of course, every APRS station on the air is displayed as a 5 window "tiny-web-page"...

So I just thought of another QUERY-Response. If you "Query DX" then what you get back on the APRS channel is a "TWP" showing you the nearest DX CLuster, its Frequency, and its direction and distance from you.

Right now I sure could use this information. I wanted to tune in a DX spot to capture an example for this Email, but I have no clue what frequency they are on. Sure would have been nice to do a QDOS DX and have the answer back in a few seconds... :-(

Does anyone know where we can get a list of the LAT/LONG and FREQ of every DX cluster???

de WB4APR, BOb

P.S. I only cross posted this to the AMSAT-BB because of the SATELLITE
Tracking and SATELLITE SCHEDULE which were the original idea behind these
"TWP's". The fact that they are forced to all users shows how great a
resource these are for all satellite operators...

>From now on, I will try to contain my enthusiasm :-)
and keep it over on the APRS sig as this concept further develops...

Hello,

I see that the old D7A program will not work with the new D7A. Has anyone
tried just downloading memories to the D7A instead of downloading all?

I suspect with the new parameters in the radio that the number of parameters
downloaded has changed. You may be able to get around it by just downloading
the memories.

Well I sent my D7A in for repair and upgrading last tuesday. No word yet but
I think it will be a few weeks before it is returned.

Yes, I tried it a few days ago. It will not work with Kenwoods software, but
will work with Link7's.
You can write in values for all the channels you want, then press write.

Here's the link:
http://www.qsl.net/wa3hrl/link7.html

But, do not try to load the whole .d7 file. It will not work.

If I understand what you are saying here, you are suggesting putting it in full duplex while it is in TNC mode, then moving it back to APRS mode. I've tried that and when it gets back to APRS mode it is not in full duplex. Perhaps I misunderstood the instructions, or perhaps Shin knows of an undocumented command via the serial port in APRS mode that will do this.

Rendered body type: text/plain

Just thought of another Tiny-Web-Page that again uses information already built into APRSdos... Mile Markers.

If a D7 Queries MM#145 I95
He gets back an object at that mile marker. SHwoing him the range and bearing to that location!.

Have you ever noticed that when you break down, there is never a Mile marker in sight? ANd then when you call on the local repeater and say that you need help at LAT/LONG coordinates, no one on the voice repeater has a clue where you are?

That's the importance of Mile Markers in APRS. It is a "translator" between APRS/GPS users and VOICE TRAVELERS/Police. I find it invaluable while QSOing on the interstates.

Or, You hear a VOICE user that needs help at MM 113. YOu use your D7 or D700 to QDOS MM#113 I95 and bingo, you get an object at that location!
... Well, close enough anyway. The APRSdos MM system should get you to within a mile or so. Its built in for the whole country.

But if you are serious about APRSdata for your local area, it can be easily improved to 0.1 mile accuracy or better by simply adding finer detail in the data base for your area.

de WB4APR, Bob

139. [htaprs] Help: pocketAPRS & GPS

From: "Eric Cuthbert" <va3ewc@rac.ca>
Date: Sun, 11 Jun 2000 11:3:17
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Message-ID: <LYR845-90169-2000.06.11-11.06.27--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Guys, can somebody help me figure out why I cant get my gps working with
pocketaprs (equipment and settings are listed below). Probably just
missing something silly but I cant see it!!

The gps works fb with the d700/d7a in aprs mode but when I use
"pocketAPRS", I get the gps with a grayed out circle and slash indicating
that the gps is not there or bad data. The "I Am Here feature" showes "!"
and no "x hairs". When selected and tapped, my position is manually placed
and not updated. All other features of the program work fb.

I have checked that the gps info is working with the rig. I have tried with
a 4800 & 9600 Baud rate and nothing works.

Any help would be appreciated.

-=73=-   Eric - va3ewc

Equipment and settings:

Radio: D700
       aprs packet mode
       nmea96
       com port - 9600

GPS: Eagle Explorer

       nmea 0183 (2.0)
       nmea out - on
       string - rmc/rmb
       Baud rate - 9600
       Parity - none
       Data bits - 8

Palm: PalmIIIxe

PocketAPRS - v.1.08 (also tried v.1.05)
Settings:
        Call - va3ewc-9
        UTC - -5
        TNC type - Kenwood
        Dual port TNC checked
        GPS checked
        Dara rate - 9600
        ARC unit - DD MM mm

Rendered body type: text/plain

I ran a test this morning with my D700, AFilter, and WinAprs 2.4.7.
KC9XG-1 is my digipeater, and is running with WinAprs 2.4.7
AFilter was monitoring the Internet feed using a seperate computer, and
capturing data orginated by KC9XG-14 (D700)

The following was captured in real time from the Internet feed.
Comments were added as positions were reported.
The D700 was configured to send location every five minutes and
status text 1/3

KC9XG-14>APK002,KC9XG-1*,RELAY,WIDE:@111447z4134.33N/08803.26Wk000/000/Mic-E
/M0/Off duty>

1/Enroute...]"6:}

The same D700 packets show up consistantly with 2 different locations and
timestamps that are 40 minutes apart. The locations differ by as much as .02
minutes latitude, and .02 minutes longitude. One includes status text and the
other doesn't.

AFilter did not detect the raw D700 KC9XG-14 packets. Other raw D700 packets
show up for other D700 stations.

WinAPRS 2.4.7 showed that N9NWA and N9RER-15 were digipeating the packets. The
time shown by WinAPRS for the last packet was 111557z.

KC9XG-14 D700 data is being corrupted by at least one IGATE. Your mileage may
vary.

Make a truly tiny list.
Just one entry. In my case it's called
DIA.POS
it's just the pos file for that airport.
Then if I need to know how close I'm getting,
just query DIA.

The time difference could be just that the times on the 2 IGate's computer was different. This is a problem with creating packets from other packets. There is a simple solution. It never will get implemented. Too many people involved, too many programs.

Brent

Well....not 5 minutes after I sent my help msg, I figured out my gps
problem. Turns out that the pocketaprs likes gps data @ 4800 and not 9k6. I
figured that everything should be the same baud rate(tnc, com port and gps
)....go figure.

sorry for the band width

Regarding the time difference...

Perhaps the authors of the various IGate programs could implement NTP
functions into their code that can't be turned off ?????

That may help to reduce the number of bad time stamps considerably but will not eliminate them. Packets could travel several hops, and get IGATED at one or more of these hops. If the packet arrives near a minute boundary then it is possible to have one or more of the converted packets with different timestamps.

If the enduser application was responsible for timestamps rather than IGATES, the timestamp would not be a factor. The enduser application could also then do it's own dupe checking and eliminate duplicate locations.

This follows the exact pattern of trouble I've had here with Igating D700's. It was suggested that it is just a PC clock issue with other digpeaters. I don't think so... I've sat here and watched the data come in "real time" doing the same experiment as above, and the duplicate/unwanted packets really do arrive 10-20-30-40 minutes later.

In my case that I posted, I was the only Igate operating at the time

There are a number of issues with APRServe/APRSd, TCP/IP, what ever we call the "system". An example was presented today with packets with time difference of converted Mic-E/D7/D700 packets. I would assume that the packets as presented came in close proximity, yet with markedly different timestamp. That is one problem, and probably a local computer time problem.

There is another problem and that is the latency between APRS servers.   I have observed significant time delays with packets. I have watched my self drive home "in real time", with 15 minutes lag time. Or how about 2 TCP/IP stations trying to KB-to-KB where one is on one server, the other is on another. I've seen a number of minutes of delay between them. That is why I added a method to query the another APRS+SA station's server being used so both can be on the same "frequency".   Otherwise the lag intolerable. Note, this does not happen all the time.

So there are at least 2 issues with respect to timing of packets.

Jim,
  As I said, your mileage may vary. This depends on the number of hops, which IGATEs are doing the conversion, and possibly, the time of the month <grin>.
 In fact, my D700 packets are now taking a slightly different path now, using different digipeaters but the results appear to be the same since the same IGATE, N9RER-15 is still gating my packets with the 40 minute old timestamps.

It would be useful to know what software is being used in each IGATE. I wonder if this is available anywhere? It may be possible to determine the offending application(s) in your local area.

I can't imagine what would cause the delivery of a packet to be delayed by 10-20-30-40 minutes. Will continue to look.

> There is another problem and that is the latency between APRS servers.

OOPS, darn problem with Outlook Express sending an unfinished reply I
thought I had moved to the Draft folder. What I meant to continue saying
was, I can understand the difference it timestamps of a few minutes, but I'm
watching the data come in real time so I can't suspect it being solely a
timestamp issue. Latency most likely.

As Bill asks, I'm curious as to what different versions are doing the
conversions; what TOCALL
they are sending their conversions to; and what criteria they try to
meet when selecting a packet for conversion, as in the example again below.

KD0XQ-5>T1QQ4T,K0BOY-1*,WIDE:'|[am@bv/]"7e}
KD0XQ-5>APK,APS:@041939z4110.85N/09602.46Wv003/012/TM-D7/M2/IN SERVICE]"7W}
A=001106
KD0XQ-5>APRS,K0BOY-1*,WIDE/1:@041939z4110.85N/09602.46Wv003/010/E>dsy/M2/In
Service]"7W}
KD0XQ-5>APK101,K0BOY-1*,WIDE:@041938z4111.43N/09603.68Wv270/013/Mic-E/M2/In
Service>

Of these TOCALLs, what software/version is responsible for each one? Also,
do any of these software versions attempt to convert something they heard on
the Internet stream (ie. something that may have *already* been converted)?
These conversions should ONLY be taking place at the point of entry, and not
somewhere downstream on the internet feed. Again, in our case, there was
only ONE Igate within RF range of the mobile (maybe a second at the fringe,
a third only in extreme tropo conditions), but at any time (locally here)
the number of possible entry points is entirely limited.

So why are these superfluous conversions taking place? The entry Igate
should do the conversion, post it to aprsserve, and that should be it.

Thanks
Jim N0RMO

I am currently using a D700 interfaced to the Garmin GPS 35-PC. I have the
D700 set to NMEA, which is defaulted at 4800 baud. However, I can also set
the D700 to NMEA 96, which will interface to the GPS unit at 9600 baud, as
opposed to 4800 baud. Will I see any noticable advantages in moving the
interface up to the faster speed?

Larry

Maybe I am missing something here, but the original packet either
comes out with a timestamp or the Mic-E format gets translated by an
Igate and the timestamp is put in ... any succeeding IGate should just
take it as is, it shouldn't be mucking with the timestamp. The data
BillD showed the time stamp changing after the packet had been
converted from Mic-E format. Now if some rogue IGate code is changing
things its should not be too hard to track it down. On the other hand
it doesn't make sense that a frame could be making its way around to
an IGate much farther away and getting converted later making the time
stamp being different more understandable but leaving unexplained why
the difference in conversion values for the position.

Does any body have a handle on just when this started happening? Is
it purely confined to D700 posits? Did anything else happen in the
same time frame (I.e. major re: of some IGate code, etc?)

MicE packets do not contain timestamps.

One MicE packet may be heard by multiple IGATEs. The IGATEs may
be in RF range of the originating station or several hops away. Each
will convert the MicE packet in its own way. The conversions by
multiple IGATEs can occur in parallel. Each inserts a timestamp
according to the system time current on his system. The
location, heading, and speed may be converted to different
values by various IGATE applications. The IGATEs may
format the packet differently by converting all text to uppercase
or inserting a wide variety of text not in the original MicE packet.
Some IGATE applications strip out any status text.

Some IGATES pass the raw, and converted packets to the Internet
feed while some only pass the converted packet. The raw packets
may have non-printing characters stripped out.

A single MicE packet can result in as many as 3 or 4 different
converted packets appearing on the Internet feed, along with
a copy of the original MicE packet as sent, or with non-printable
characters stripped out.

The servers check for duplicate packets. However, since the
converted packets may not be consistant, these packets are
not considered dupes, and passed to connected clients.

It is almost impossible for applications receiving these packets
to determine that these are dupes since each one will be different.
Furthermore, each packet may be considered to be valid.
End user applications may decode the Raw MicE packet.
This can create yet another location record for the original packet
on the end user system.

Under certain conditions, in certain areas a single MicE packet
may spawn a half dozen or more packets to be seen on an end
user application connected to the Internet feed. Furthermore
some of these packets may be IGATED back to local
RF networks.

>

IMO it has been happening for quite a while. It became more
noticeable when more users purchased Kenwood products,
and other MicE capable products became popular. It is not
confined to Kenwood products.

There are multiple IGATE applications and there could be
several versions of each currently in use.

It is my understanding that no one is currently managing
the Internet feed since K4HG went on to other endeavours.
He has repeatedly asked for someone to step up and
undertake this task. Over time, the quantity of data on
the Internet feed has grown considerably, and the
quality and integrity appears to have, IMO, degraded.

That idea was a "could do". It is not in place now. But if you run
APRSdos, it will work locally for you. Just hit MM MD95 145
Which will draw a LINE on your map intersecting the Interstate 95 in
Maryland at MM 145. ALl of this data is in MILEMARK.DAT in the system

folder. The data base covers all interstates in all states except for
those few that still do not have mile markers.

To make it respond to Queries, I need to add some more code....

  All of this is simply avoidable. Mic-E is simply not that new. It is
conscionable that such a large bunch of technically gifted people
cannot get their acts in sync. I think almost all of the Igate code
is in C or C++ - why not get the codesmith's to share routines and be
done with it! The idea of the APRSWG was to create a benchmark suite
to verify/assure compatability. I guess that hit back burner ... we
could sure use it now.

[snip]

  The answer doesn't lie so much in replacing Steve's position as it
does in getting the IGates to comply with some standards or they not
permitted to login to the server. In my rarely so humble opinion it is
better to have less data that is accurate than lots of data strewn
with crap!

 If high APRS areas start not showing up on the map because their
IGate suite isn't validated ... then maybe local pressure will see to
it that it gets upgraded to compliance.

Note that you also have to pay for the shipping back to you, so it will be a
bit more than $60. In California, Kenwood is also charging $4.95 sales tax.
I had thought that the upgrade only involved a firmware upgrade, which
should have been labor only (and hence no charging of sales tax), but the
invoice said that a defective part was located and replaced. I had no idea
there was any defective part.

I drove to Cerritos and dropped my D7 off on a Friday afternoon. Kenwood
called me the following Tuesday to let me know it was ready.

They take all the knobs off, unscrew all protruding shafts, remove the
back, HAND solder with magnifying lenses at least 3 jumper wires to tiny
pads on the surface mount mother board, then plug in another 16 wire (or
so) programming header, and then sit there for 15 minutes while the
programmer re-programs the ROM, verifies and tests it. THen the three
wires are unsoldered, jumpers removed, radio reassembled (from a basket of
parts), a sticker is attached and the whole thing is logged by serial
number, repackaged, and all paper work completed and then returned to you.

Oh yes, and the guy doing it at Dayton was the original DESIGN engineer
who designed the radio, not just some technician... So, in my opinion,
It is a non trivial exercise... and done at cost.

Where can one find the specifications that cover iGate behavior and Mic-E
handling???

Hey guys,,, do I get this right or don't I??

Mic-E provides a two dimensional position, lat., & lon.
Other APRS sources provide a three dimensional position,
lat., lon, and time.

Now, IGATEs apparently provide *only* three dimensional
positions and if the source, e.g. Mic-E, doesn't have a
time they assign a time, *their* current time?? There is
nothing wrong with transforming data, e.g. when changing
media, when 'mixing' data with other systems data, etc.

But,,,
,,,unless there is a formal, accepted, and perhaps even a
correct way to make up data, then this, if true, sounds
like a data integrity problem. Again, if true, the answer
should be obvious to any parent: Kid comes home from
soccer practice and says 'I was hit and now my knee hurts
when I do this.' The answer, of course, is 'don't do that'!!

164. [htaprs] Re: Going Digital... Ham Radio?

From: "Gregg G. Wonderly" <gregg@skymaster.c2-tech.com>
Date: Mon, 12 Jun 2000 10:42:08 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-90473-2000.06.12-10.49.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

>We are not doing a good job of promoting nor explaining what digital
>is all about. The following message I received says it all...
>de WB4APR, Bob

There are a number of things about APRS which I don't know the history of.
When I review the spec that exists today, it is clear that low bandwidth, hard
to deal with data streams are pervasive. It is clear that this was a good
thing early on when modems supported this technology easily. FCC mandated
bandwidth restrictions play an even bigger factor I suppose.

In todays digital wireless environment, WAP is becoming very popular as a
means of allow handsets to communicate with remote systems which are present
on intranets (of the carriers), as well as on the internet. APRS seems to
have had two distinct focuses. Early, it appears that the GPS location
portion was an important factor given the expansion of APRS. The messaging
provided in the spec, as well as the "private data" facilities will allow APRS
to be used to provide unicast as well as multicast/broadcast transport of all
kinds of data.

Over the summer and into the fall, I will be developing a new class of APRS
application (trying to use the existing transport/addressing infastructure)
which will be targeted to deliver the following functionality.

o   WAP/WML navigation and browsing tools for information search and
        retrieval.
o   Map location/positioning as most APRS apps support today.
o   Resource management infastructure that will allow the Amatuer
        community to provide better support in dire emergencies by using
        APRS for managing the location and distribution of physical
        resources. This is a time when voice bandwidth is not strictly
        required, and by providing such things via packet, we can
        be more productive on other frequencies.

This application will be written in Java and will initially be targeted at the
platform created by Netpliance in the form of their I-Opener. I will be
placing this device into my vehicle and using it as the APRS system for my
TH-D7A.

--- futuristic thinking ---

The folks at aJile.com are close to starting production on their Java processor. We consulted with them for the past 2 years to get them focused on low power with plenty of I/O expansion. We have been using the PC-104 demo board for exploration, and have found the platform to be promising.

The APRS software that I am creating will be useable on this processor because it is just Java. What would be really cool is if one of the HT companies would get together with aJile (I can help this happen) and arrange to evaluate their processor for use in a new HT. The new HT could then support downloading of Java applications that could provide custom packet data support, or new UI features. Because Java does not allow access to physical memory, the vendor could quite readily control the execution environment so that such user apps would not crash or affect expected operation of the HT.

There are numerous Java powered phones and two-way pagers that are on the market now (RIM blackberry pager, Motorolla and Nokia phones) or will be soon (Motorolla committed this past week to making all of their products Java powered within the next two years). There will be a large number of applications written for these phones, and some of the games and other non-commercial software could be used on a Java powered HT (for those who like games).

Certainly the power and protection/security of the Java VM is a big attraction to eliminating the simple buffer overrun kinds of errors that the TH-D7A has suffered from. But, more than than, the new Java realtime specification (www.rtj.org) provides for the kind of timing and predictable execution that allows Java to be used for a huge range of applications that people have scoffed at in the past. Go to java.sun.com and listen/watch the Day-2 keynote starting about 1/2 way through to see a real-time java demo that shows the aJile PC-104 boards being used to drive robots playing chopsticks.

On Mon, 12 Jun 2000, Michael Bass wrote about APRSdata:

> One thing that seems missing is a similar report for open voice
> repeaters. The RPTR query could return a frequency, offset, and PL for
> the nearest repeater.

It does that. Just send TO: QDOS   MSG: VOICE

It will return the nearest Voice repeater that is in the APRSdos database.
I have been trying to build up this file of Voice-APRS-Friendly repeaters
over the years, but now maybe people will start adding to it in their
area.

My original intent for the VOICE OVERLAY that is built into APRSdos was
NOT to list every voice repeater (90% are hardly ever used), but to only
put in this database the "wide coverage", "travelers" repeaters. You
know, the ones you always find on the air with the truckers and travelers
and you can always find activity or someone listening...

If anyoone wants to add their favorite to this database, please send it to
me with LAT/LONG, and PL..

For LOCAL use with the APRSdata server, you might want to make separate

files for 2m, 70cm, 6m, and 10m?

These tiny info bites sound really neat. Some info I'd love to see would be
frequencies & pl tones for repeaters in the vicinity (say, up to 20 miles
from my location). No more lugging an ARRL handbook etc. Could this be done?

Its already done. Its built into APRSdos. Now with APRSdata, the remote
D7 and D700 users can now request that info over the air. But yes, the
database does need to be updated. The QUERY format is

TO: QDOS
MSG: VOICE

The response is an object showing the nearest voice repeater, and any PL
etc...

This might be too simple, but...

To use the D700 with the Palm you have to be in PACKET mode and NOT APRS
PACKET...from your description below, I couldn't tell.

I'm using ver 1.08 with my D700 and Garmin II+ with no problems. I switch
back and forth between APRS PACKET and PACKET all the time. APRS when I
don't use the palm and PACKET when I do use the palm. Switching back and
forth is quite easy, so I find myself using both modes a lot.

I will say that since I started playing with the APRS PACKET mode, I have

learned to really like it. If I need mapping and messaging, the palm is
terrific. For normal running around, the internal (APRS PACKET) mode is
AMAZINGLY good, and does a really nice job with dxSpots, as well.

Hope this helps...at least we know it works. 73

 This is a touchy subject. Many repeater owners are so paranoid (some
with good reason, the other just need to get a life!) regard divulging
their repeater location with the same feelings as revealing state
secrets!

While building the "Tiny Web pages" for the 78 local clubs listed in our Wash DC/Baltimore area, I realized that most of them listed both their meeting schedule and their NET schedule. Thus, I now decided to build two files. One to respond to CLUB and the other to respond to NET...

Just a thought. (Im posting it here because I did not think of this till half way through and so have to do half of it over again...) :-(

That's why I insisted that APRS support position ambiguity. You can remain ambiguous to 0.1, 1, 10, or 60 miles... Just enter spaces where the digits go...

173. [htaprs] Mic-E and reformatting

From: "Mark D. Conner" <mconner@null.net>
Date: Mon, 12 Jun 2000 18:13:08 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-90587-2000.06.12-18.20.26--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

As I understand it from reading the thread on how Mic-E positions are being propagated on RF and Internet, the basic problem seems to be this: different software packages handle the conversion of the Mic-E format in different ways. This combined with propagation delays on the RF side, I-gates without a good time hack for the system clock, and time delays between the Internet servers all contribute to multiple position reports being generated from a single initial Mic-E transmission.

How to solve? I'm not up on all the technical issues, but here's a way to start:

1) Consistent, standardized conversion of Mic-E packets before retransmission (RF, Internet, or crossovers between the two). If you convert it, you have to meet a spec. Who's gonna write it and what the spec should be I don't know, but it sounds like there should be one. Lack of standardization here seems to be kicking our butts.

2) Part of the conversion should be a checksum based on the initial Mic-E report only, not any time stamp added. If a second I-gate picks up a Mic-E report sometime later, it should generate the same checksum during the conversion. This checksum could be detected by APRServe to prevent duplication. How to do this on the RF side only leads to....

An open question: Should any software reformatting Mic-E packets add a
timestamp that was not part of the original transmission? Including the
time stamp is making up data. Granted, if all is well it should be a good
guess, but sounds like not much is well in some locations. Do we want the
software to "guess" at the time of transmission? My answer would be no, but
your answer may vary.

I may have glossed over some technical issues that could be tough to
resolve, but I think we need to get back to first principles here.

Something similar could be accomplished when converting the raw
MicE data to another format such as base64. This would handle the
non-printable character problem as well.

Time stamps should not be added during the conversion process. The
insertion of time stamps creates the most trouble for the Server and
all client applications. If the MicE packet is used as I believe it was
originally intended, then the enduser application shuold assigns the
timestamp on receipt. Insertion of time stamp also unnecessarily increases
packet size.

Rendered body type: text/plain

Hello group, I'm in the need for assistance. I am building a APRS station for Field Day. The radio I have is a Yeasu FT227R connecting to a KPC 3+.

The station can see stations and it looks like it's transmitting the transmit lights on the TNC and the radio both come on but messages are not getting out. I tried to send a message to my D7(G) but it didn't make it (my call was different on station and radio).

Does anybody know how they wiring should be. The radio mic has a 4 plugs and the only places I saw how to wire a Yeasu showed plugs with 6 and 8.

Any help would be great

Rendered body type: text/plain

I got two comments from Kenwood that might help in the design of the
external keyboard project:

>METHOD #1 - Touch/Tone encoder
> -1 needs to modify the mic connector. It is not easy for
>   the beginners.

***You can use Kenwood MJ-89 microphone switch. It allows you to use
two Mic lines in parallel.

> -2 You have to push some keys on the radio before entering
>   message. ([MSG]-[DOWN]-[OK])

***You can use the PF keys on the MIC. So the keyboard should
have four PF keys on it for microphone.

I think what he is saying here, is that the PF keys can be programmed to
do any funciton you want. SO if one of them is programmed to be
MDG-DOWN-OK, then you can use that function to begin a message without
having to go to the radio front panel. But I dont know how the PF keys
are encoded? Are they digital? Hardwired? or non standard (greater than
16) DTMF?

Bill, All,

I've only been into APRS for 6 months, so I'm a little confused.   Is
the "non-printable" character problem the only reason for conversion? It
seems to me that all the mapping software supports the raw Mic-E packet
as is; or am I wrong about that? Frankly I find conversion of tiny
little MicE packets into big ole APRS packets to be a waste of rf and
landline bandwidth.

I just don't get why the TCP/IPAPRS packets must have no "non-printable"
characters. TCP/IP is 8 bit. If the reason is: "because the mapping
software needs to log the packets" then my answer would be: "then the
mapping software needs to do the conversion for logging only".

Hi, and good luck at Field Day!

One of the things I remember about this radio is that it uses a relay to accomplish some PTT operations. If you don't hear the relay operating, the KPC3+ PTT circuit may not be able to pass enough current to key this radio. Note that for some time (at least 15 years?) an exact replacement relay has not been obtainable, so using an FT227 on packet is not a good long-term prospect for the radio. A couple of friends have worn out the PTT relay in the FT227 using it for packet.

I took a quick look at the suggested web site, and didn't find the FT227 listed explicitly. There is a reference to Yaesu 4-pin connector wiring (diagram 192). You may want to try confirming it using an ohm meter. Ground is easy, and if you find a pin that's less than 200(or so) ohms between the hot incoming power wire and a mic jack pin (with the radio power turned on), this is virtually certain to be the PTT pin. You can also use the ohm-meter between what you think to be the appropriate pins on the microphone plug, then key and unkey the microphone, to verify the PTT connection.

When I used my 227R with my KPC 1 (ahem) I found that I would eventually destroy the audio output. I finally quit using it on packet when I had to replace the relay and the audio several times. I use it now as a backup radio on voice only.

There are MUCH better qualified radios for serious packet duty than the 227R.

185. [htaprs] Message filtering?

Date: Wed, 14 Jun 2000 09:13:15 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-90893-2000.06.14-08.16.38--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have a D7 and a D700 which I use interchangeably in several vehicles. I'd
like to have the radios filter for only messages addressed to me, bulletins,
and notices from the National Weather Service. The D700 manual states that
the 'mine' filter will reject messages not addressed to the operator. This
sounds wrong. One would think that bulletins would pass the filter. I
don't have documentation on the D7 upgrade, so I'm not sure how it filters.
Does anyone know how filtering works on these two models?

Thanks
Rich Carter - KE1EV

Maybe your NB96 needs pre-emphasized audio. Try running the audio to the
Nb96 via a very small capacitor to emphasize the audio. Start with a .001
and see what that does.

I skipped over this when I saw it the first time. I built my self a cable supplying power to both my Garmen III+ and my D7A for use on motorcycle, bicycle and car. I supply the power directly from the battery in the car and motorcycle and from a video camera battery on the bicycle. I added an inline inductor in line with the positive side, no capacitors. The only time I have any problems with the D7A is when I am traveling through areas like I-287 up by the Tappen Zee bridge or southern I-95 in CT where I get a feeling that every ham has a digipeater from the number of packets I was receiving.
I think it is correct that you want a clean source of power. The spikes, RF etc. on the electrical system of today's modern cars can confuse the smartest of Kenwood's creations.

I can not wait till I hear the new software is available for the D7G so I can send my D7A in for upgrade. I'm tired of discussing a subject to the point of almost timing out the repeater only to hear "Where did you go?" I have a problem looking at the radio while riding my Gold Wing through the traffic on our nations highways.

I thought that this might be of interest to list members. I have available a Garmin GPS-III+ for sale. I am the original owner. It is less than 1 year old and has only been used about 3 times. It comes with the original box, manual, pc/GPS cable,etc. I will also include a homebrew cable for connecting the III+ to your Kenwood D-7A as well as the optional Garmin case for the III+. It is in like new condition and doesn't have a scratch on it.

I will ship it for $280(firm) in CONUS. If interested, drop me an email at: sereikas@worldnet.att.net

Rendered body type: text/plain

Members,

I received my newly modified TH-D7A (G) yesterday. This coincided with K2SAT setting up his APRS digipeater here in Tuscaloosa, Alabama and K2SAT receiving his new TH-D7A (G). The digi works well. I can receive all sorts of out-of-town APRS data at night. K2SAT plans to raise the antenna in the future so we can have daytime coverage as good as the nighttime coverage.

We have a problem with our (my) TH-D7A (G)'s. I cannot get the digi to digipeat any data that eminates from my TH-D7A (G). I have tried to go through the manual and set up every parameter that I can find to no avail. My home is 2.4 miles from the digi. I have set and reset the callsign, path (relay,wide;

relay;wide;k2sat-7;k2sat-7,wide;etc.), transmit delay, etc.. I set up my other HT to receive 144.390 and listened to it beacon the info. It sounded like 1200 baud traffic.

Can you think of some parameter I am not setting or K2SAT has not set on the digipeater that would prevent the TH-D7's from having their data digipeated. Other out-of-town stations seem to be able to get in but I have not seen any TH-D7's. K2SAT is also having a similar problem with his TH-D7.

Do you know if K2SAT and I get together with our HT's whether we will be able to see each other's beacons and verify the units are transmitting correctly.

We are both newbies to APRS and probably need some elmering.

Hi Joel, Try putting dummy loads on both transmitter and receiver. Also, move the PacComm as far away from the the TH-D7A as possible. You could be getting RF into the PacComm which interferes with the operation.

I have a TM-D700A setup in TNC Pkt mode and linked to my computer. I am having no problems in picking up the stations in the local area but can't seem to send or receive messages. I am running APRS 2.4.6

My friend tells me that the messages he is sending me are not getting ACK and I'm not sure that I am transmitting. In looking at my history it is blank.

Please help!

Rendered body type: text/plain

This version of APRSdata.exe adds many items to the default files:

  ATV, CLUB, CAMP, FD, DIGI, DX, FD, WX, NWS, NWR
  HELP, HOSP, IGATE, NET, PARK, RS, SATS, VOICE

And when you ask for HELP, it sends that to you on the DX list instead of
wasting your message memories.
Also, now it will not send AO27 at night when it is off.

Read the README\APRSdata.txt file for details.   APRSdata.exe is
distributed as ftp://tapr.org/aprssig/dosstuff/APRSdos/adat-exe.zip
which includes all the unique files you will need to use APRSdata
in your existing APRSdos system.

Most of the data files you already have because they are included in
APRSdos, but you need to rename them. THe new files are just what I
built for my area, but they will at least show you the format.

If you out an APRSdata system on line. Please let me know so we can
coordinate our coverage areas.

de WB4APR, Bob

>> This is a touchy subject. Many repeater owners are so paranoid (some
>> with good reason, the other just need to get a life!) regard divulging
>> their repeater location with the same feelings as revealing state
>> secrets!
>
>That's why I insisted that APRS support position ambiguity. You can
>remain ambiguous to 0.1, 1, 10, or 60 miles... Just enter spaces where
>the digits go...

Or you can offset by a small amount (would 1/2 mile really mess things up
that badly?) so the basic center of the coverage area is still the same, but
the antenna is "not to be seen".

A bit of DF work will find the transmitter antenna with or without such
published info anyhow.

Furthermore, repeaters which use multiple inputs over a large geographical
area (and a voter circuit to select the best input for any particular user)
can actually skew the "input coverage area" of the repeater. In this case
publishing the "center of mass" for the input coverage area may be a better
approach than where the actual transmitter is located.

Rendered body type: text/plain

Hi,

I know it's a pain in the b*tt but I did a cut and paste,between the
two databases, using the notepad text editor. The D700 database has two
additional fields which I filled in with zeros, when I transferred from the
D7 to the D700 database. After the new database was created, I looked at the
data with the D700 and made any adjustments. Create temporary copies of both
databases and play around with them. Oh yeah...the D7 database starts with
record 0 and the D700 database starts with record 1, so you need to either
shift everything or move that record, using your text editor. You might
check but I think there are TAB delimiters between each entry. Most of the
fields you can look out and figure out what they are. If anyone has figured
out all the fields, please let us know!

Rendered body type: text/plain

Good morning all.

Yesterday I noticed I had strange characters at MSG INPUT. I could delete them
but they would not stay deleted. Once I went to the end of the string of
characters to try to delete from that end and the HT locked up.

I then referred to page 32 in the Instruction Manual and followed the steps for
a partial reset. After selecting OK I got the message "RESETTING! wait a
moment." That's where it is hung now. I have to pop the battery off to turn it
off. Pressing F+Power On does not send me back to reset.

BTW, mine is an early production unit (SN 00900057) with the firmware upgrade
but not the G. I was counting on taking it to Boy Scout camp in North Carolina
next week (I'm from Mississippi).

The Kenwood Service Center in Virginia Beach is not answering the phone yet this
morning. Any ideas? Thanks in advance.

My new program, link700 will do this. Actually, I just completed the
programming for cut-n-paste last night (are you watching outside
my window ?). It can copy entire blocks of channels from one type
of radio profile to the other, as well as copying to different channels
of the same radio. I knew this would be a valuable asset to people
who owned both radios.

Unfortunately, link700 is not yet ready to be released. I'm working
on it as hard as I can, and hopefully it should be ready to test in a
week or so. Keep an eye on my web page for news about it:

- - - - - - - - - (END)

Apparently the online help desk has no idea what the shops are doing, except in the most general sense, so questions like "what is your turn around time" is best answered by calling them _directly_.

As I am in Maryland, I called the Virginia shop and asked my questions. Basically they want:

- A note instructing them what you want done (ie: I want the D7 (G) upgrade).
- A credit card number or other payment (I used the credit card approach, as that prevents the problem of figuring out the $60 + shipping beforehand.)
- Return shipping instructions. (UPS Ground is their standard return service.)
- Contact info to reach you if they need to.

The following is the letter I enclosed with the radio, and which doubled as a packing list. Feel free to use it if you want. I cut out the specific info that I don't want to share :-)

- - - - - - - - - (START)

Date: June 9, 2000
To: Kenwood Service Center East

Hello,

I wish to have the firmware in the enclosed TH-D7A (S/N: ########) upgraded to the new "G" version.

If any other damage or problems are discovered, please call me at the number below to discuss fixing that as well. I can be reached at:

###-###-#### (Work)
###-###-#### (Home)
halehome@home.com (Home)

Please bill the $60 + Shipping to the following ####### (ie: a valid card type they accept) card:

Card number: #### #### #### ####
Expiration date: ##/##
Name on the card: XXXXXXXXXXXXXXXXXXX

My shipping address is:

PUT YOU SHIPPING ADDRESS HERE

Thank You,

Darrell Hale

- - - - - - - - - (END)

I shipped the radio by UPS Ground on Friday the 9th. UPS reported delivery in Virginia on Monday the 12th. On Tuesday I received the following email:

- - - - - - - - - (START)

Return-Path: <kscv@pop.mail.rcn.net>
From: "Kenwood Service Center, East" <kscv@erols.com>
To: halehome@home.com
Date: Tue, 13 Jun 2000 13:04:26 -0400
Subject: TH-D7A#10200300, Darrell Hale, Claim 50####
X-Confirm-Reading-To: "Kenwood Service Center, East" <kscv@erols.com>

X-pmrqc: 1
Priority: normal

Your claim # is 50####.

We have received your unit. Unless you specifically
requested an estimate, we will e-mail an estimate if
we feel repairs will exceed $100 plus shipping/handling.
There is a $25-35 diagnostic fee plus return shipping
& handling for refused estimates. If you did not provide
credit card information the unit will be shipped UPS COD.
The UPS computer will notify you via e-mail when the unit
ships. You should have a Money Order or Certified Check for
the UPS driver made payable to us.
Kenwood Service Center, East
(757) 340-1702 (Customer Service) (757) 340-6809 (FAX)
Status checks on your unit should be made to Customer
Service. Other requests may be made via e-mail.

   - - - - - - - - - (END)

At this point I'm just waiting to get notification that the radio is on it's
way back (or that is simply shows up on my doorstep).

I was going to wait until I got the radio back before posting my experience,
but your comment above prompted me to write anyway.

Darrell

At least you guys can get an upgrade....last word here
was that Kenwood Australia is not interested in doing
the upgrade at all. So much for support on my 6 week
old D7 :-((
Guess where I will be getting my D700 from?? certainly
not Australia. Kenwood Australia sucks......

> After selecting OK I got the message "RESETTING! wait a
>moment." That's where it is hung now. I have to pop the battery off to turn
>it off. Pressing F+Power On does not send me back to reset.

Mine did this yesterday, locked up completely, and will not come out of the
"RESETTING! wait a moment". I packaged it up last night and am sending it off
to the repair center this morning after calling Kenwood East yesterday
afternoon.

Sigh...

The only common thread I can think of is the wierd message. My friend sent me a message, and just as he did, a freakishly long string of nonsense characters showed up. I deleted them, and when I tried to send a response, the unit locked up. At this point, I was able to remove the battery and plug it back in and the unit would wake back up, but every time I tried to send a message, it would lock up again. So, I tried a reset. It came back with the "Resetting!..." message, and stayed that way.

I took it to the Kenwood Tech booth, and a Mr. Lee looked at it, and said I needed to send it in; it was probably a firmware bug. I pointed to the guys who were doing the revision G modifications, and asked if they could do it, and he said, "No, not this one." I don't know what that meant, other than I was out of luck for a handheld for the rest of Dayton.

I think it may have just been the massive amount of data on the channel, with some packets trashed packets. This may cause the firmware to start executing out of unwritten memory. Definitely sounds like a firmware bug.

Does anyone use the Custom messages? If so, are these decoded correctly by any
existing applications? I have sent several packets using custom messages and
have not seen these converted correctly when viewing the Internet feed.
 WinAprs 2.4.7 does not decode them either. Can't find any custom messages on
the feed, let alone the ones I transmitted. Apparently, the custom message
designation is ignored.

Maybe you are expecting too much? A custom mesage C5 for example means
nothing more than that. CUSTOM MESSAGE 5 means "C5". You and your
recepeint must agree apriori waht that means. It is only ONE BIT in the
Mic-E format.

ARGH! We built one with internal MIM module and GPS for the Atlanta
Olympics. I should have thought about that and sent it to you. It ran
for 6 hours on a set of D cellsa in the handle... :-(

Its pieces now. 6 months ago, I started scavanging parts from it..

I spoke with the customer Service people at Kenwood (Canada) this week.
They mentioned that they should be in a position to do the upgrade on the D7
in about a month's time. Around the middle of July we should contact them
and see if they are ready to do the upgrade to the D7A (G). The cost will be
similar the cost in the US. (C$100).

>downloading of Java applications that could provide custom packet data
>support, or new UI features.

Instead of starting from scratch with trying to get a new radio designed
around the aJile, what about retrofitting an old radio with the new
processor? Mabye use one of the simple kit type radios that has a few simple
functions like changing frequency, etc. Continue the experiment by
interfacing the processor to an external TNC, GPS, LCD display, etc. You
would not only have a prototype tool to experiment with, but a functional
demo of what you want that can then be shown to your potential manufacturing
"partners".

Seeing something that actually works would probably go a long way to
starting a real discussion of how to better refine, integrate, consolodate,
minituarize, etc. a new design based on the potential of a prototype.

>Sorry, but could you define what WAP & WML stand for? :-)

WAP stands for Wireless Access Protocol, and WML stands for Wireless Markup
Language. WAP provides the transport of WML accross wireless connections,
doing compression and other things related to the management of communications
between the phone and the WAP access gateway that will convert requests for
information into HTTP operations, and then send back the returned information.

WML is and XML based specification for content. It consists of a "deck" of
"cards" in the simplist analogy. Basically, the phone downloads and caches
the deck, and then lets the user "flip" between the cards which are really
just menus, text and graphics where supported. The deal is that with the
phones support WML, you can create interactive service, like HTTP and HTML
pages, but with small displays in mind, and really just operations being
displayed to the user, except for some help text or status text from an
operation initiated by selecting some action specified in the WML card.

Well, I will most likely go there, but I will do the software first, and
use my existing TNC equipped radio as the test bed. I really want to be
able to provide this software to the community for use on any existing radio
and TNC. The integration would be a benefit gathered from purchasing newer
radios, like the integration on the TH-D7A and D700 have provided.

The limitations of the single application on these two radios is very
real. Having downloadable and updatable software would make it much
easier for everyone to participate in changing how we utilize the spectrum
to its fullest...

>command. Or users can request it with the Q-SATS message.

OK, I'm really confused. Not being a regular APRSdos user, the selections
available on the P-LIST to Uplink a satellite when in view are confusing.
Also what do all the color codes for the various satellite data lines mean?
Purple, Blue, Yellow, etc. And what about the characters to the left of the
time? **   *_ etc.

I've selected to uplink a few of the satellites, but they are transmitting
every minute even when on the other side of the globe. Now how to I
UN-UPLINK them (take them out of uplink mode)?

I don't seem to find any further documentation on the many options here.

Thanks...

Purple are OBJECTS. Yellow are YOUR objects being uplinked
Dark blue are KILLED objects, White are APRS stations that CAN QSO, gray
are passive trackers and digis etc that cannot QSO. See SCREEN.TXT

> I've selected to uplink a few of the satellites, but they are transmitting
> every minute even when on the other side of the globe. Now how to I
> UN-UPLINK them (take them out of uplink mode)?

When you first select them for uplink, the act like any other APRS object
and are transmitted immediately and then on the usual "doubling" of the
period until they decay down to once every 30 minutes.

  * Note: It takes APRSdata 20 seconds ore more to cycle through the list
    after that, then the new UPLINKED objects will be converted to KILLED
    once it notices that they are on the other side of the earth. But
    still, this KILLED object will still follow the decaying algorithm

Thus, things dont stabalize until several minutes. later when all these
new objects are decayed out of the system. I need to write some code to
ease this transition..   Be sure to do a QUIT-eXit so that the
SELECTIONS on the P-LIST are remembered for the next run... Else, you
have to do it all again.

to UN-UPLINK, then just select them and hit U again. If they are killed,
then you will need to do it twice until you get the * which means an
OBJECT. + means it is being u plinked and "_" means it is killed.

 Bob

I think we have some missunderstandings in France. I post this here only
so some of our European friends can see that they may have some work
to do in gaining acceptance over there... Thanks to jdreifuss who found
this and translated it.

By the way, this is NOT unique to Europe. We went through this same thing
over here in the USA too, when APRS was new back in the 1993-95 time
frame... I just thought you would be amused by seeing it anew... I
removed all email addresses because I do not want to see any flames...

Actually, I heard that APRS was being used by internet pornographers and
neo-nazi groups (both clever CIA fronts) to undermine the Eurodollar. I saw
it on X-Files.

I think it's high time we use this technology to track all the UFO's and
black helicopters.

Are these innocent collaborators sending thier rectal temps willingly
.....? This does sound very suspicious indeed!

Although Bob has "sold APRS to Kenwood", they do not appear interested in
this rectal temp sending feature, because they have not integrated it into
their TH-D7A, or even the TH-D7(G) upgrade. You actually have to download
the Free APRS software to utilize this handy feature (with the addition of a
weather station). Perhaps Kenwood will add provisions for fully mobile
rectal temp monitoring in a future TH-D7 upgrade, but right now this is
limited to desktop stations (as it well should be). Please close the shades
while operating in this mode!

Just thought I would clear that up.

Walter

221. [htaprs] Repair turn arounds on D7A

From: "Eric A. Cottrell" <eac@shore.net>
Date: Fri, 16 Jun 2000 19:20:30 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-91312-2000.06.16-19.23.20--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

Well I sent my broken D7A off to Kenwood East two weeks ago and they acknowledge reciept via email on the 6th. I thought I would check up on the radio.

I did not want to bother them via phone so I sent an email. I had no reply and discovered upon reading some Kenwood info that they want a phone call when querying about status. I would think email would be easier but I suppose you need to have another person dedicated to answering emails. So I did the redial every 15 seconds or so until I eventually got through.

The result of the conversation is they have not even looked at the radio yet and the customer service person does not have any idea on turn-around times (by design?).

I am wondering if all the D7A techs are busy getting the flood of upgrades done with one day turn-arounds and not getting to the repairs. Or maybe they are busy replacing the broken encoder in units that came in before mine.

I can understand if they are busy and I can understand that radio repairs can take awhile but it is still disappointing to hear they have not even looked the unit over in 9 business days. It is not like it is a major problem, just replace the sma connector, plug in a new encoder, figure out where a chip capacitor goes and resolder the chip capacitor.

I hope to get the D7A back before the leaves change color and drop from the trees.

What turn-around times have list members seen for their D7 repairs?

Far from seeing them 'exploiting' this hobby, I take off my hat to the likes
of Messrs Bruniga, Dimse et al. for their ingenuity and labors.

I seem to recall from history that the transmission of electromagnetive
waves was once the sole domain of a few dedicated 'amateurs' who took a
concept and developed it. I suspect now that F1HDD and the like condem the
commercial exploitation of those early experimenters that now provide radio,
TV, cellular services, etc - and aligned with those who conceptualized
refridgerators, vacuum cleaners, motor-cars, airplanes etc. None of these
things just appeared one day at the end of a production line.

Almost every walk of life, be it a hobby or some other aspect, is
provisioned with equipment, accessories, or some other form of revenue
generation. Kenwood took the bold step of producing two radios, through, I
suspect necessary colaboration with Bob and others. So what?

I, and it seems many others here, choose to vote with our dollars (or
francs) to support these ventures, either through the purchase of equipment
or the registration of software. Does our French friend think that the
years of work contributed by Bob and the others is their's just for the
taking?

The Frenchman is precisely wrong. The usage of the ham bands is on the
decline and we are likely to lose most of our spectrum in the next few
decades. APRS is the fastest growing segment of ham radio today (Why do you
think Icom is so nervous about the D700 and the TH-D7?!) APRS is the best
hope ham radio has to retain its spectrum for another generation or two.

I'm not sure about the rectal
temp thing. I can't see that
getting my friends interested.

I guess we need to make pos files
for that data on the Tiny Web Pages.

now seriously -

I'm inclined to build small TWP's. Perhaps
with only one line. Example -

DIA.pos is just the position
of Denver Intl Airport...

911.pos returns the nearest major voice
repeater w/ 911 autopatch...

2m.pos returns the nearest 2m repeater...

440.pos returns the nearest 440 repeater...

whois.pos returns the owner of the TWP machine...

fire.pos (just a concept, not up yet) this would
return updated info on some current wildfire.
There could be similar files for flood, quake,
whatever. This would have to be kept updated
and a stock "No current fires" file should
be in place when appropriate...

others???

Interesting to watch the interaction of different
flavors of APRS. On my desk are D7A, WinAPRS and
DOS APRS. It don look da same twixt versions!

Today I listened to Paul Rinaldo W4RI (ARRL) at the AMRAD symposium
talking in general about regulatory issues and I learned something new.
He says that the basis for amateur radio in Europe does not include any
reference to "public service" as it does here in the USA. THus if it is
not experimental or just-for-fun, then it is not perceived as"amateur
radio" or somewhat milder words to that effect.

If this is true, then I can see somewhat how a European, who views helping
out at a public service event is already a "violation" of the rules,
would see APRS as a threat. But even Public service events in my opinion
I do just for fun too.   I guess it depends on what you think is fun...

Would any Europeans coment on this subtlety about how they view "public

service" aspects of HAM radio? If the perception over there is different,
and even built-into their rules that way, then that might help us to
understand each other better...

233. [htaprs] Measurements on TH-D7A

From: "Johann Lochner" <lochner@ing.sun.ac.za>
Date: Sun, 18 Jun 2000 04:10:13 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-91493-2000.06.17-21.13.43--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi folks,

Two TH-D7A(G)'s arrived at the Sunsat control station on Thursday.
Now we won't have to test new features in the blind any longer :-)

I'm new to this list, but did not find much independent results for
TH-D7A performance measurements in the archives (like bit error rate
tests for the modems, etc). Anyone know of results published on the
Internet?

It really is an impressive little rig, packed with an amazing number
of features. However, it's somewhat disappointing that you can't
interface to the high bandwidth (9k6) audio input/output directly.
Are there instructions for doing this somewhere?

A few CASUAL measurements performed today points to some sub-optimal
characteristics in the transmit paths. Both modems' waveforms was
received on an Icom IC-821H (both bands) and displayed on a scope for
which the Icom's frequency deviation to voltage mapping is roughly
known. The radios performed much the same.

Kenwood TH-D7A(G) [S/N: 11200031]

Carr. [MHz]	Mod. [bit/s]	Remarks	Dev. [kHz]
145.825	9k6	eye slightly closed	1.9
	1k2	high tone	2.8
		low tone	2.6
436.290	9k6	eye very much closed; poor convergence at sampling instants	2.0
	1k2	high tone	3.0
		low tone	2.6

Has anyone else obtained similar results? I'll try to repeat the
measurements in a better calibrated environment soon. The poor 9k6
eye for UHF is disconcerting from a Sunsat point of view (while its
APRS services are activated in Mode B). The deviations seem somewhat
small too. Isn't the norm for 9k6 packet around 3 kHz? The obvious
high pass filtering of the 1k2 modem output (visible after reception)
is also surprising. Or not?

Kind regards,
Johann, ZR1CBC

> What kind of modem for ACARS?

Unfortunately, the only one that works with my APRSair is the DSP12.
THats why no one uses it. Its a $795 TNC! I used the one at work to
test, but didnt realize that it was th eonly TNC that converts the ACARS
to ASCII in hardware. All the rest do it withintthe PC..

I have not made any quantitative tests, but I did notice that while
receiving a D700 on another D700 and looking at the AUDIO from the SPEAKER
on a scope, that I observeda clear 6+ dB rolloff of the high tone. I was
very much surprised at this. It told me that Kenwood has chosen to
balance the tones at the descriminator (with no advantage taken of
Pre/dEMphasis normally assumed on an AFSK FM channel. I have NOT
published this, but asked kenwood.

I have not gotten an answer other than they said that USA Hams like to
hear bassy audio and so the speaker does have high frequency roll off.
But they did not say what is their "standard". Yet you say you are seeing
"high pass", which is the opposit of what I was seeing. But then you are
looking at another receiver (presumably de emphasized?) And I was looking
at the speaker.

I have never looked at 9600 baud.

Do you agree that 1200 baud audio AFSK should be balanced at the "mic and
speaker" which are the connection points for 99.9% of all ham radio TNC's?

Your data above was not clear relative to whether yuo expected deemphasis
on receive or not.   SO can you clarify for me you opinion? Thanks. bob

I haven't looked much at the receivers of the D7 and D700, but I did
casually look at the transmit deviation of both radios and found that
neither was applying standard pre-emphasis (at least in the 1200 bps
packet mode). What I observed was similar deviation for both of the 1200
bps tones. There may be a little high pass filtering, but certainly not
the standard 6 dB per octave.

Bob Bruninga makes an excellent point that there could be a major
difference between European regulators and the FCC in connection with Ham
radio use of the scarce spectrum resource.

I have a little different spin on this. One of my Economics Professors in
college pointed out that ultimately, the free marketplace will always win
out over the Regulators, given enough time (Bill Gates: Are you listening
over there in Medina?). My Professor pointed out, for example, how key
deposits for apartments went to $10,000 when the New York City government
instituted rent controls in the 1970's, and how a taxi medalion in NYC cost
over $100,000 way back in 1970 (I think they now go for more than
$500,000).

As far as arguing about various "appropriate" forms of ham radio usage of
the spectrum, we need to realize that unless something big changes, it is a
moot point---so long as we continue to use this scarce spectrum resource
without paying for it, we are sure to lose it to commercial interests that
are willing to pay for it.

How much are our VHF and UHF bands worth in the open marketplace in the US? In the last 3 years, FCC spectrum auctions have typically brought in about $10 per POP per 10 MHz of UHF spectrum (a POP is a person, or one population) in the US. Currently, there are 275 million POPs in the US. Given that our Ham licenses cover the entire US, it is easy to calculate the estimated commercial worth of our bands (this estimate will not be precisely correct, but it will be directionally correct).

Between 50 MHz and 2.4 GHz, US Hams have 177 MHz of allocated spectrum, on a primary and/or secondary basis. Based on the FCC spectrum auctions, at a dollar worth of $10 per POP per 10 MHz, given that there are 275 million POPs in the US and there are about 250,000 ACTIVE Hams, do the arithmetic. This works out to $200,000 per active Ham.

So, the commercial value of our VHF/UHF spectrum (not counting our microwave bands and HF, etc) is $200,000 per avtive Ham in the US alone! Since most Hams don't have this kind of money, or even if they did have it they would not be willing to pay this price, how much longer will the Fed let us use this scarce resource FOR FREE in a capitalistic economy? Maybe another generation or two, if that?

My point is that differences between Europe and the US in terms of Ham radio usage regulations pale in terms of what we really face---the complete loss of a large part of our Ham spectrum, and quite possibly very soon. I hate to sound like Wayne Greene, but unles we get usage up, I believe the hand writing is on the wall.

APRS is the fastest growing segment of Ham radio today, so I say to the grumpy 'ol Frenchman: Blow Off! We would like to save our Ham bands so we can continue to enjoy them with NEW DIGIATAL TECHNOLOGIES, and we don't need your grumpy advice!

BTW, for those of us that think the Public Service aspect is the saving grace for Ham radio, let's face it---every time there is a car wreck on the freeway, the Police get 100 cell phone calls for every one (hard to understand, crackly, half-duplex, antiquated analog) autopatch call from a Ham operator. Same thing is largely true for natural disasters: typically, the cell system works fine, and the days of the voice Ham operator having significant impacts in emergencies is coming to an end, unless we get Hams to use APRS!!

I have no idea yet about the rest of Europe but I'm doing a crash course in learning the UK system and so for your reference I quote from the UK Radio Amateurs Examination Manual:

> "An amateur radio license is issued under the authority of the Secretary for Trade and Industry for the purpose of self-training in the science of radio communication and to allow technical investigation of that science. Any other activities in which radio amateurs may be involved, such as contesting, radio direction finding and DXing are just a means to the above end." (pg 6)

I refer to BR68, however (the nearest equivalent to the FCC part 98) which states:

> "... However, amateurs have always been ready to put their skills and experience at the service of the community; this additional function is officially recognized by provisions in the license to use certain frequency bands for passing messages to assist the emergency services listed in paragraph (12)(1)(o) of the license."

That part of the license (12)(1)(o) states:

> o) "User Service" means the British Red Cross Society, the St John Ambulance Brigade, the St Andrew's Ambulance Association, the Chief Emergency Planning Officer ("Chief Emergency Planning Officer" means

an Emergency Planning Officer who is not responsible to any higher
Emergency Planning Officer, such as a County, Regional or Islands
Emergency Planning Officer) or any United Kingdom police force, fire or
ambulance service, health authority, government department or public
utility...

So there you have it :-) Personally, I was involved with Red Cross
activities in the US and hope that I will be able to find similar activities
here in the UK to participate in.

M/N9OXE (awaiting my UK reciprocal call)

Today I listened to Paul Rinaldo W4RI (ARRL) at the AMRAD symposium
talking in general about regulatory issues and I learned something new.
He says that the basis for amateur radio in Europe does not include any
reference to "public service" as it does here in the USA. THus if it is
not experimental or just-for-fun, then it is not perceived as"amateur
radio" or somewhat milder words to that effect.

If this is true, then I can see somewhat how a European, who views helping
out at a public service event is already a "violation" of the rules,
would see APRS as a threat. But even Public service events in my opinion
I do just for fun too.   I guess it depends on what you think is fun...

Would any Europeans coment on this subtlety about how they view "public
service" aspects of HAM radio? If the perception over there is different,
and even built-into their rules that way, then that might help us to
understand each other better...

First of all, as I commented previously, you shouldn't expand the
comments of one person to be representative of anything other than that
one person's opinion. So I think this is all very much a storm in a tea
cup.

Also, you can't regard European amateur radio as one entity. There are a
lot of separate countries over here, each with its own culture and each
with its own ham radio regulations. (For instance, when it comes to how
packet radio is regulated, there are very significant differences.) The
comments that are being made about "Europeans" are roughly the
equivalent of me talking about "Americans" in the all-encompassing sense
of including both continents.

For what it's worth, our regulations in the UK start with these
statements:-

1. (1) The licensee shall use the Station for the purpose of self-
training in communication by wireless telegraphy, which use (without
limiting the generality of the foregoing) includes technical
investigations.

1. (2) The Licensee may use or permit the use of the Station, as part of
his self-training in communications by wireless telegraphy, during any
operation conducted by a User Service [defined in sub-clause 12(1)(o)]
or during any exercise relating to such an operation for the purpose of
sending Messages on behalf of the User Service to other licensed amateur
stations.

And a "user service" is defined as:-

12. (1)(o) "User Service" means the British Red Cross Society, the St
John Ambulance Brigade, the St Andrew's Ambulance Association, the Chief
Emergency Planning Officer ... or any United Kingdom police force, fire
or ambulance service, health authority, government department or public
utility.

So there is certainly an aspect of "public service", but it applies to
special/emergency situations.

In terms of restrictions on commercial use, the regulations say:-

3(3) The Licensee shall:

(a) have no pecuniary interest (direct or indirect) in any operations
conducted under this Licence; and
(b) except as provided by sub-clauses 1(2) and (3) and except in the
case of activities on behalf of a non-profit organisation established
for the furtherance of amateur radio, not use the Station for business,
advertisement or propaganda purposes including (without limiting the
generality of the foregoing) the sending of news or messages of, or on
behalf of, or for the benefit or information of, any social, political,
religious or commercial organisation.

(In interpreting 3(3), the self-appointed "policemen" of UK amateur
radio show an unbelievable level of hypocrisy, but that's another
story...)

I can't speak for Europe <g> but in the UK the essence of the license is that
it is for 'self training in wireless communication'. The only public service
aspect is that the police may -through a licensed ham- make use of an amateur
station.

The emergency radio network (Raynet and I think another one) are quite
sophisticated in their organisation, but are still 'hobby' based.

Also we aren't allowed to sell anything via amateur radio - or do any
business using the medium.

We have only been able to pass third party greeting messages comparatively
recently. Internet hook up requires a specific notice of variation to
your license. No phone patches.

(mind you, we dont get many Tornados either, so its not all bad)

The speaker output on the TH-D7A(G) is useless for 9k6 comms. It is
low pass filtered; didn't even bother with it further. I have not
done anything to determine the MIC response yet. Can't see why it
will pass 9k6 if the SP doesn't. I wasn't aware that pre-emphasis is
used on NBFM channels. The Icom IC-821H does no pre/de-emphasis.

It would have been extremely useful if the audio in/out ports had
full bandwidth connections to the varactor diode and discriminator
output. For a start, testing modems over RF from a test bench
couldn't be made easier. You also wouldn't be limited to the
internal TNC for experiments. Does the RF/TNC integration of the HT
limit possibilities for tapping into these paths directly?

No de-emphasis on the IC-821H, as indicated above.

> I have never looked at 9600 baud.

> for me you opinion? Thanks. bob

If with "balanced" you mean a flat response, I would agree. I don't

expect pre/de-emphasis on NBFM channels (with this I may be wrong).
Ideally, to accommodate 9k6, I would expect a flat response from 0 Hz
to 7200 Hz. ;-)

For me the problem lies not primarily with the 1k2 signal. It is
much worse for 9k6. Its deviation seems too small. There are also
some low pass filtering visible from the VHF transmitter; even more
so in the UHF case. Hence my interest in bit error rate tests (not
that easy to perform without full access to the relevant paths).

Don't get me wrong: I think this is a wonderful radio and expect much
pleasure from it in future. It can be made even better, though.

Kind regards,
Johann, ZR1CBC

Am I losing my mind, or has the D7 software on Kenwood's FTP site
vanished?

Just brought home a D7A(G), to find the software on the CD/Cable pkg
only for the D7A, and absolutely no software on their site.   That's a
bit weird.

My D7 was hopelessly locked up, in need of a new case and keypad (dropped quite a few times but kept on working fine until running on external power in APRS mode for about 6 hours). Two weeks later, the shiny new case with a (G) upgrade inside arrived at my door.. I think that this is a great turnaround since they contacted me twice and had to wait for my reply

Now if I could only get my Yaesu FT-757GX II back from Yaesu repair (sent at the same time).

My D7 (G) upgrade just arrived last friday. The paper enclosed with my upgraded D7 said that there was new software on their ftp site. I couldn't find it!

<endsnip>

Ryan,
I've received a beta copy of the new software which supports the (G), from Kenwood.

I've run Norton Virus Scan on the zipped file, and believe the file to be clean. However, when I unzipped it, the .doc file was corrupted. The application, MCP-D7G, seems to run ok, but I've yet to check it out entirely.

I've notified Kenwood of the corrupted file, and await an answer.

If you or anyone else wants a copy of the zipped file, email me direct and I'll send it along.

Hmmm. Thanks for the additional datapoint... I guess we'll just have to
wait.

In other news, I'm having difficulty with my Streetpilot and the 'G. It
works fine on my D700, but does nothing for the 'G.

I also received the new TH-D7 (G) programming software and everything works
fine. My .doc file is NOT corrupted. It opens up and the instructions read
just fine. You must have gotten a glitch during youir particular download,
etc.

Hello All,

As the heading says, I am looking foreward to a 3 week long cross country
trip with my sons Boy Scout Troop.

I am hoping to use HF Voice, HFAPRS, and PacGate APRS, along with the usual
TMD700 line of sight stuff. My questions relate to HF and propagation on
30M APRS. I am new to HF APRS so any help would be appreciated. Also
suggestions on Satellite Ops, PacGate, and who or where in Central/Western
US/Canada/Alaska might be operating these modes. I am presently
experimenting with Satellite, and hope to get some more experience this
weekend at Field Day.
More to come..

And Good Luck to all on FD.

Thanks in advance, and any replies can come direct, so we dont clutter the
Sigs.

N1EZT, Pete Guimond (n1ezt@arrl.net)

Not here - it's still my understanding that it doesn't accept anything
upstream.

"In other news, I'm having difficulty with my Streetpilot and the 'G. It
                        works fine on my D700, but does nothing for the

'G."

When you interface the D700 to the Garmin Streetpilot, are you saying that you are able to read-in waypoint data from the D700 into the Streetpilot and see callsigns and their associated icons on the Streetpilot?! (You said "It works fine with the D700." Not sure if you meant OUTPUT ONLY, or INPUT AND OUTPUT.)

Unless Garmin has changed something in the last 10 days or so, my experience with the Streetpilot (color screen) and the D700 is that the Streetpilot is able to input position data into the D700. However, the D700 is NOT able to load waypoint data into the Streetpilot. Thus, the Streetpilot is UNABLE to display callsigns and their icons on its screen. The same thing holds true for the GPSMAP 295.

I have the latest Garmin software downloads from Garmin's web, so it shouldn't be a question of software versions.

Can you let us know what's up?

Thanks!

Larry

You must have missread my email. I am only talking about 1k2 via the speaker.

> I wasn't aware that pre-emphasis is
> used on NBFM channels. The Icom IC-821H does no pre/de-emphasis.

ALL amateur AX.25 1200 baud AFSK on NBFM in the USA assumes the user hooks up his TNC to the SPEAKER audio and Microphone audio. THus it has the noise suppression advantage of all pre/deemphasized ausio used on NBFM. There are some individuals who have hooked directly to their discriminators and modulators, but they experinece a 6 dB skew interoperability problem when trying to work with anyone else.

> It would have been extremely useful if the audio in/out ports had

Why would one invest $500 for a radio with a built-in-TNC, if he was then going to hook up an external TNC? In this case he would use an $88 HT radio I think?

> No de-emphasis on the IC-821H, as indicated above.

Then a normal properly balanced 1k2 AFSK NBFM signal should show 6 dB greater level on the high tone than the low tone... as received on your radio. But as you say, you see a close balance, so apparently Kenwood is not pre-emphasiznig its transmissions. THis explains why it sometimes has trouble decoding some other signasl that are STONRG, but imbalanced.

> > I have never looked at 9600 baud. > >

> Ideally, to accommodate 9k6, I would expect a flat response from 0 Hz
> to 7200 Hz. ;-)

Yes, flat response at the discriminator for 9k6 FSK, but flat at the
speaker/mic for 1k2 AFSK. THus a 6 dB skew if viewed at the disc.

> For me the problem lies not primarily with the 1k2 signal. It is

Is yours a THD7E or A? the E has narrower filters I think to mee the
European requirements?

By working fine, I meant that the D700 is able to read position from it, not
that the D700 is able to upload other stations to the display.

Sorry for the misunderstanding; I was attempting to contrast it to my luck with
the 'G to date, which has been no input or output luck with the StreetPilot.

256. [htaprs] D7-G Software Problems-No New Features!

From: "Larry Zanella" <larry.zanella@attws.com>
Date: Mon, 19 Jun 2000 0:24:10
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-91704-2000.06.19-00.27.42--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

On this past Friday (June 16), Kenwood sent me an email with their new D7
-G programming software attached. I unzipped it and successfully loaded it.
The title says T7-G and under Help it also clearly shows it as the G
version.

It is labeled as T7-G Beta V 0.00.

So far, I can't find any of the upgrade features promised in this PC
programming software---it looks like none of the new featurews are
supported in the G model at this time, unless you manually program them in
from the radio without using your PC and the associated prigramming
software.

For instance, the G model is supposed to support 3 My Positions, rather
than just one like the old model (but not 5 like the D700). Anyway, it
continues to support only one My Position in the G programming software.

I am finding the same thing for all of the other features that Kenwood's PR
sheet advertises for the new features supposedly supported by the new G
version--so far, they are not there.

It appears to me that in the rush to get some kind of PC programming tool
out there to support the G model, they have released this Beta version. It
appears that it will let you program the new G model with your PC (which is
better than before since the old PC software was completely incompatible
with the new G version). However, it appears to me that this Beta version
does not support any of the new features of the G model, at this time. And,
I don't see any way to even get the memory channels transfered from the old
PC software to the new PC software for the G model.

Looks like we will have to wait for the Beta version to be replaced before
we can program the G version with any of its new features via our PCs.

Sure wish they would have said this in their "read me" text---would have
saved me from wasting a lot of time.

Larry

Hi Bob, Larry and the other US-hams on the list!

I hope my virtuosity in english is good enough to explain some things between the european and the us ham radio regulations:

Your are both right, but it depends of the point of view. In Europe third party traffic is only allowed in case of emergencies when the public network is down! But without phonepatch ... on both ends must be an ham radio operator. So it is not possible (allowed) to serve the public with some services through amateur radio!
The understandig of the most european authorities is, when we use our amateur radio bands to provide professional content, than it is not amateur radio! And in this case we will lose some bands or segments .... The government needs money and the industry will pay to get our frequencies !! Our telecom authorities do not allow to mix the amateur radio with commercial content! In some eu countries it is a problem (not allowed) to link a packet radio link via an IP-tunnel through the internet....I.e. the TCP/IP protocols via packet radio with ham web application, e-mailing, file service a.s.o. is a wireless application which several telco companies want to provide us - for money!

So US-hams please understand when an eu-ham is fighting to keep the amateur bands - but in a way you may understand not right!
In Europe ham radio is a very highly experimental radio service with more technical and experimental aspects than in other regions!

Since Bob has described his APRS system and several software developer have released their software for APRS also in eu the "APRS fever" is increasing rapidly!! For my person as a ham I like to experiment with APRS via satellites as well as chatting via satellites.

We all have the same target to save our bands. With traffic, with new developments, with experiments, with education - several ways but the same target!

All--
I'm a newbie to APRS and am considering purchasing a GPS to go with a TH7A(G).
My understandiing is that the GPSIII+ IS ABLE to display callsigns,
icons etc. on the map/screen from the TH7A(G). Or is it the
discontinued GPSIII?
Do I understand then that the StreetPilot and the StreetPilotColorMap
are NOTable to display the callsigns, icons etc on their screens?
Is the Garmin "GPSIIIplus" the recommendation for GPS receivers at this time??
Thanks for your patience.

So... I thought it was just me- but it isn't.

I and two others have noticed that our upgraded THD7A radios no longer
parse the data from the Garmin GPS 3+.
The blinking occurs, and it quits when we disconnect the data cable- so I
know the cable is fine.

The radio setting we are using is NMEA, not NMEA96, although I tried NMEA96
too to rule out a command inversion.
Both GPS's and cable work fine on my D700.

What is wrong with these radios? Is the G version messed up?

Ralph

Mine works great with the GPSIII. Do you have Waypoint set correctly? It
should be set for 6 digit NMEA for the GPSIII. This setting tells the D7G
whether to send the data to the GPS, and how many characters the GPS can
handle for its waypoint title.

Walter

Hi Bob,

> Why would one invest $500 for a radio with a built-in-TNC, if he
> was then going to hook up an external TNC? In this case he would
> use an $88 HT radio I think?

Ouch, we paid around $815 for ours (shipping included). It would
have been nice to have the other options available at that price.
Even better, imagine all the possibilities for experimentation when
being able to (a) connect a signal source/sink (modem) to the HT's
mod/disc and (b) connect the HT's modems to external tranceivers.
Guess this is wishing for too much.

> Yes, flat response at the discriminator for 9k6 FSK, but flat at
> the speaker/mic for 1k2 AFSK. THus a 6 dB skew if viewed at the
> disc.

Sunsat does no pre-emphasis on its 1k2 AFSK signals. It should thus
be balanced at the HT discriminator. That'll lead to some skewing at
the speaker. But why would you want to hook up an external TNC? ;-)

> Is yours a THD7E or A? the E has narrower filters I think to mee
> the European requirements?

TH-D7A(G), ordered from the USA.

Kind regards,
Johann, ZR1CBC

Larry,

ICOM is nervous? Seem they are so far behind on APRS and new radios they may never catch up. Even Alinco has a radio with a built in TNC. All ICOM has new is an HT with a built in TV screen.

Does the Garmin GPS III+ accept way points of 9 digit NMEA length from
either the D7 and/or the D700, or are you limited to the 6 digit NMEA?

Hi All

I may be out of line here as I have no real idea what the discussion has be in this regards. But what I can pick up is there seems to be some discrepancies about what a Ham can do in the US and what a Ham can do in the EU. It seems to me that they clash some where.

This is been the argument here in South Africa for some time. If the rest of the world can do it so can we! With in reason that is. A few months ago we, my local ham radio club, set up a phone patch system. Now this is some thing that is totally taboo here. But we pointed out to the authorities that ham radio was going though a technological change. This means rules have to change to keep up. So what happened was we got permission to have a phone patch set up on our local repeater.

It is simple if you can not do some thing because your regulations do not warrant it, then change them. If we do not get the rules to bend to our needs then there will be a lot of new developments that will be lost to 100 year old rules!

I hope I have not gone off in a tangent in the wrong direction but I feel I have heard this song sung in a different key before and it does not need to be like that. It is after all just a hobby for all to enjoy.

oops, I am wrong. You can save 3 different profiles for your STATUS
and for your POSITION.   Maybe that is all. Maybe you cannot save
different UNPROTO paths. Bummer.... Yes, I just checked. You will have
to change the PATH everytime you change between Satellites and
TEerrestrial.... :<(

The corrupted .DOC file is the Japanese version of the README. The strange
characters in the filename are the Japanese Kanji. If you rename the file,
and open it in Wordpad, it'll display fine... just in Japanese! :-)

The new D7A(G) programming software currently has numerous limitations and
ommissions, but at least it does allow you to reload all your memory
channels. I've detailed all the ommissions and limitations that I have
found and sent them to Kenwood.

If we could get the satellites to support the alias of RELAY or WIDE, then
things would be so much simpler.

Hi Tim,

> If we could get the satellites to support the alias of RELAY or
> WIDE, then things would be so much simpler.

Amongst other BIG improvements, that option is in the pipeline (after
an earlier suggestion by BB). Now, if we could only get the sun from
messing with our plans! Hold thumbs for your FD. A quick experiment
to coincide with the activities might be forthcoming. If it happens,
I'll let you folks know beforehand.

Kind regards,
Johann, ZR1CBC

I've lost the capability to receive position data FROM the Streetpilot
(with
the 'G). Again, on the D700, the same GPS works.

Since I've never been able to send waypoints to the GPS (limitation of
Streetpilot), does this waypoint setting (illogically) have any effect
on the
parsing of gps/serial/nmea data by the radio?

Actually, I got sunsat to support APRSAT as a generic name. But now I see
your point. That if we have to constantly change the path in the D7
between terrestrial and satellite use, then we may as well make the
spatellite be WIDE. DOes anyone else see a problem with this?

Or what the heck. Why not relay?... naw... some areas of the country
outlaw that... I think WIDE?

Hi There

I wounder if some one can shed some light on this for me. I have just been
informed by Kenwood South Africa (Trans RSA) that the TH-D7(G) will only be
offered in the US. Does any one know if there is a UE ver of this rig?
(TH-D7E(G))

I am a little unsure how Johann got his two but I do know that they where at
one hell of a price and for not much more you can get the d700A here.

But as the saying goes "if there is a will there is a way!" :-)

I was told that I would never get a d7 here and well I have had one for over
a year new.

Many thanks

Peter

All,

I don't really see why the satellite config necessarily needs to change.

A mobile user who wishes to toggle back and forth between ground digis and satellites can just leave "WIDE,APRSAT" as the path, right? That way a digi or a sat would digipeat it, if received.

Sure, that's an extra few bytes in every ground packet, and an few extra bytes in every satellite packet, but it's not really that significant. Especially when you consider that we are talking about MIC-E formatted posits, anyway.

In order to survive while mobile through non-WIDEn-n areas, we have to leave it set to "RELAY,WIDE,WIDE3-3" anyway.   The worst path I could see having a legitimate purpose would be "RELAY,WIDE,WIDE3-3,GATE,APRSAT" (That is obviously an extreme example, needed only for I-70 between Denver and Salina KS, where, if you actually hit a digi, it is most probably caused by signal bounce off of an extinction-class asteroid passing through the ionosphere.)

Anyway, I assure all prospective users, that there is a lot of free time to be found driving through western KS, wherein you can change your UNPROTO path, balance your checkbook, complete a 12-step program, revise your will, do your taxes, estimate the amount of shielding required to safely operate at 1500 watts PEP from a rooftop antenna, and take a nap (cruise control equipped vehicles with good alignments, only, please).

No, DIGI paths are used in sequence. No match, not digipeat.

Rendered body type: text/plain

Hi

Many of us (including myself) have made our own DH-7/PC serial cable instead
of buying Kenwood's. My ancient 386 computer is quite RF noisy and I made
sure that I had included torroids on each end. Of course the TH-7 didn't
hear a thing with the computer on. I gave up on using my current computer
with the DH-7. That is until I read a posting regarding the addition of R/S
snap on torroid. Well! That sure made the difference! Now I can start
learning how to use APRSdos.

For all newbes and those who had given up hope of using their noisy PC with
the DH-7 and a home brew serial cable try the big R/S torroid, it should do
the trick.

Thanks to whomever suggested the solution!

Robert, KD6INI

Hi,

As far as I know there has not been a G Update for the E type...
The only update for the E type was for DAMA and KISS Use..

For instance the E Version does not accept GPS Data with 4 Decimals.

I wrote Kenwood about it but they have still give no answer on that one...

I think the update for the Version E was not GPS related, just packet...

By the way it seems that the updates are not compatible...Anyway as I took
my 7 with me to the US, Kenwood US told me they could not perform the update for the E
version....

Next time I will buy an A Version because main goal is APRS for me and not as a
replacement for a TNC
which is not to be mend but often used by german hams

It cant replace a tnc but many hams do not accept that and so the 7E got some bad critics
here in Europe.

279. [htaprs] Interfacing a PC Keyboard to APRS equipment

From: Darrell Hale <halehome@home.com>
Date: Tue, 20 Jun 2000 02:24:59 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-91950-2000.06.20-01.27.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have seen comments proviously about using a PC keyboard to control various
APRS projects.

The July 2000 issue of Poptronics contains a 7 page article about using AT
style keyboards in a hardware project. The article includes a 68HC705J1A
based demostration circuit with source code available online at:

   ftp://ftp.gernsback.com/pub/pop/pc_keyboard.zip

I have only scanned to article briefly, but it looks like it would be of
interest to those would want to know more about how the PC/AT keyboard works
and ways to use one in a project. So this is a heads-up to go checkout a
copy of the magazine.

> tests for the modems, etc). Anyone know of results published on the
> Internet?

Here is what I got from Kenwood:

Our target deviation is +/- 2.4kHz as GMSK.
Modulation target is GMSK 0.5 roll off.
When we measure the BER we tune input level of modulation
to 2.4kHz deviation.

On TM-V7, it has 40Hz to 9kHz flat frequency performance.
TM-D700 has 10Hz to 10kHz or more performance.

281. [htaprs] D700 transmit "problem"

From: Jon Ogden <jono@enteract.com>
Date: Tue, 20 Jun 2000 07:17:05 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-91966-2000.06.20-07.19.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

HI guys,

A couple of weeks ago, some folks here were complaining that the TM-D700A
suffers from the same display bug that the original TH-D7A had. That was
that if APRS data was displayed on the screen, pressing push to talk just
cleared the screen, but didn't key the radio.

After hearing all the comments on it, I decided to check it out. I went out
of town for a week so I couldn't report back.

My TM-D700A does NOT suffer the problem people complain about (early model
bought in late December 99). If I am on the MAIN screen and an APRS packet
comes in, pressing the Mic button causes the radio to transmit. I've tried
it on different bands, different settings, etc. It works as it should.

The ONLY time when pushing the PTT button causes the screen to clear is if
you bring up the APRS list or if you are looking at the GPS display or you
are looking at specific APRS data for a station. Then pressing the PTT will
clear the screen and bring you back to the main display page. I don't find
that to be a bug at all. OK, you could let the radio transmit while on the
GPS page. However, it may not be a good idea to allow the PTT to work
"properly" when you are on a display where you cannot see your frequency or
channel number.

Anyhow, my belief is that the radio works fine. Those people having the
"problem" are probably having it because they try to display specific APRS
data and then talk.

Just my thoughts.

Bob,

Okay, so I'm a packet newbie. Only one more question: Why? If a station farther down the digi path picks up the packet earlier, there is no good reason why it shouldn't digipeat the packet. It seems that this sort of design could only be expected to maximize the possibility of packet death, by using the maximum possible number of hops and therefore the maximum number of collision opportunities.

Also, it decreases the probability that a given path will work while mobile. This is sort of disturbing, especially out west where there are very few digis, but they are all well placed. I can't expect to have "one of everything in line of sight". If I don't know what alias is used on the only digi I can see, then I'm out of luck.

Because AX.25 packet was invented 22 years ago and it did not know anything about APRS at the time. At that time all operations were via CONNECTED packet and connections must be done in sequence.

APRS was designed to take advantage of the 200,000 TNC's already in existance. My first proposal for improved digipeeating was called "PREEMPTIVE" digipeating which would would do as you suggest. Accept the callsign anywhere in the path. But none of the 200,000 existing TNC's supported this and no one wrote any new software to implemnet it.

Thats why EVERY digipeater ALWAYS responds to "WIDE".

Bob Bruninga wrote:

> ...connections must be done in sequence.

Not true. Perhaps the implementors of AX.25 thought so. Many connected protocols exist that do not require the same path for every packet.

To take this conversation another direction: if APRS isn't driving all new TNC development at this point, what is? I fantasize about new APRS routing modes, such as "route to lat/lon" or "route to gridsquare" where a digi that receives a packet thus encoded will digipeat it if and only if it is closer to the destination lat/lon than the digi that sent the packet. That would obviously require routing tables with posits of all stations which have been received direct. A lot of development...

But if we are of a mindset that "APRS can only work if we design within the limitations of the worst TNC out there" then innovation is very difficult. I'm sure you know the feeling. What we really need is a cheap programmable box with one serial port to build open-source KISS-mode digipeater code for. Make it cheap to connect any KISS TNC to a controller running a common digipeater codebase. Something cheaper, smaller, and easier on the power budget than a full blown PC.

> Thats why EVERY digipeater ALWAYS responds to "WIDE".

Assuming you meant "RELAY", then I'd have to say that I've found some digi's that weren't configured thusly.

My D7A speaker blew (seems to be a common problem) during FD 1999. I sent the radio for warranty repair to the Kenwood East Coast facility via UPS at noon on a Monday. I attached a note describing the problem and the steps I had taken to troubleshoot it. I had no further conversation with Kenwood. The radio arrived, repaired and functional, back at my house on Friday afternoon of the same week.

This has been a very fun, very powerful radio, and the fantastic response time on the repair served to confirm that I made a good choice in purchasing it.

Jon,

from message sent 2/14/00, notice this was four months ago.It was a early
production radio. This has nothing to do with displays of APRS data.

 I hate to report that I have discovered a problem with my D700.

  Here is the failure mode:

   The APRS beacon is transmitting on the "B" radio. At the same time I key
the Mic to talk on the "A" radio, At this point all is well the packet data
goes out the "B" radio just fine. When it is finished transmitting the "A"
transmitter keys up (I still have the Mic key down) and I am talking into
the Mic. Users on the repeater tell me that all they heard was a dead
carrier. I have to wait until the transmitter is done on the "B" side then
key the "A" side to be heard. When you are driving it is not possible to
look at the radio to see if the "B" transmitter is active, so many times I
transmit dead air.

  Any one else see this problem .

No I meant WIDE. When I use the term digipeater here I am referring
to devices with wide area coverage.   Conversly every APRS STATION, should
by default, respond to RELAY and DIGIPEATERS in this context are just a
subset of "all" stations.

There are always exceptions. I am talking about general defaults. I
think SOuthern California is experimenting with the concept of disabling
"WIDE" for the purpose of forcing users to begin using the more
advantrages WIDEn-N process.   And where stations coexist in the same
general area, only one of them needs to serve as a RELAY for nearby
mobiles or handhelds.

Hope that helps.

Is that what you really meant??
Certainly all wide digis should respond to relay and wide, but I don't
think you want stations in close to a digi responding to relay.

It doesnt matter. If they respond, they do so at the SAME time as the
DIGI, and so noone hears them. Fratracide is intended as part of the
dupe-elimination process. Even if local QRM delays one of the packets
long enough to be delayed further by CSMA, then still a smart DIGI will
not relay it a second time because of DUPE elimination...

290. [htaprs] TH-D7(G) Won't Scan VHF+UHF

From: "hasan schiers" <schiers@netins.net>
Date: Tue, 20 Jun 2000 19:12:01 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92075-2000.06.20-19.16.07--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just got mey D7G. I have band A as data. I'm trying to program memories to
scan. No matter what I do, I cannot get band A to accept 440 freq. I can get
them into band B. When I try to scan memories, I have to change bands to see
any of the 440 freqs (memorized) scanned. That seems very strange and
doesn't work at all like my D700.

What am I doing wrong? Or am I up against a "feature" that I don't
understand.

As things sit now, I can see 2m memories in either band A or band B. I can
only see 440 on band B. When I scan B, I get only the 2m freq, unless I use
(F)unction Band first...and then I only scan the 440 freq. (This is all
referring to freqs that I have memorized. I've been through the manual
several times and I see no reference to being only able to scan either VHF
or UHF,but not both, as happens in the D700.

Help, please!

Otherwise the radio is doing nicely, esp on 144.39 aprs.

This is the brand new G model with latest firmware that was featured at
Dayton. (Although I got it from a dealer and it came with the supplimental G
manual features)...in other words this is not a modified radio, but one of

the first new "G" models to show up.

Thanks in advance, 73

Rendered body type: text/plain

Band A will only accept 2meter or aircraft band. Band B will only accept 440
or 144-148. You are not doing anything wrong, this is how both the D7A and
D7G function.

You can scan both bands, but it involves some extra steps. First you need to
be in Dual band mode. You will have to hold down VFO or MR on one band until
it starts scanning, then switch to the other band, and hold down VFO or MR
until it starts scanning.

Not sure how this compares to the TM-D700 - don't own one .... yet

Enjoy,

Walter

>
> Any one else see this problem .

Dwight,

You've brought this up before. But I see it as quite statistically
insignificant. The odds of the TNC transmitting and you transmitting
simultaneously are very small. Additionally, the packet TX burst is so
short, it makes the collision of the two occurrences even less likely. I
don't think I've ever keyed up in the way you describe.

It doesn't mean there is a problem with the code or hardware of the radio.
I think it just doesn't happen often. You seem to be the only one who has
reported it and no one else to my knowledge has noticed it. I would call it
a very slight annoyance, the probability of which happening is very small.

I don't mean to be offensive in any way. I just don't see it happening very
often at all.

The TM-D700A is similar as well. Band A will receive aircraft through
around 220 MHz and 440 MHz. Band B will RX, 2 meters and then 300 through
1296 or so. Something like that!

Same problem I have, but with the III+.
Someone else suggested turning plugging in the GPS and turning it on first,
then turning on the radio.
This stinks!
A firmware upgrade that puts us almost back where we were with the ORIGINAL
low serial numbered D7s.

Thanks, but this problem has nothing to do with waypoints. This is
receiving position data FROM the GPS.

OK guys,

I am going on another trip.

I'll be arriving at BWI around midnight. Be heading a short distance to
hotel. Then tomorrow it'll be off to Adamstown, MD. Then back to BWI and
home around 5:15 PM. Short sweet and to the point.

Those in the Baltimore/Washington area keep a lookout for my Icon: NA9D-2.

This is the brand new G model with latest firmware that was featured at
Dayton. (Although I got it from a dealer and it came
with the supplimental G
manual features)...in other words this is not a modified
radio, but one of
the first new "G" models to show up.

About 1 week ago, I spoke with Kenwood on the phone about the issue of new D7 G models coming from the Kenwood factory in Japan, as opposed to D7 upgraded in the field G models that Kenwood has in its inventory on hand in their So Cal wharehouse. Kenwwod told me that they will take their D7 stock on hand and do the mods (as described here previously by Bob Bruninga) to covert/upgrade their new stock on hand to the G series. I was concerned about dealers returning their D7 non G-models that they have as inventory on hand and getting them converted by Kenwood So Cal, as opposed to waiting and getting a G model that was born that way from the factory. From my conversation with Kenwood, they will convert dealers' new radios to G models, so that there is no way to tell if you have a D7 G model that was held by a dealer as new inventory, shipped to Kenwood So Cal, converted to a G series and sold as a G, as opposed to Kenwoods' radios on hand in their inventory that they convert to G models and ship to the dealer network. No matter what, you get a brand new, unused radio, but it has been opened up and converted to a G model. By the way, I agree with Kenwood entirely that in all cases I have mentioned, these are brand new, unused radios. But that is not my point here.

The Kenwood gentleman that I spoke with on the phone told me that he estimates it will be July (or possibley later) before they run out of pre-G models stock on hand in their Kenwood So Cal wharehouse that they will convert to G series. At some point in July (according to his estimate), they will eventually start receiving G models from the factory that were born as G models, as opposed to being born as the previous model and then converted/upgraded. In the meantime, they will take their new D7s (albeit the previous software versions) and open them up (just like they are modding customers' radios) and do the extensive mod conversion. These will then be full-blown G models, but they are converted/modified (albeit certainly new radios), as opposed to being born as a G radio from the "get go" at the factory.

My personal preference and choice is that I am going to wait until Kenwood starts recieving G models from Japan. Like a fine wrist watch, when you open up a portable radio and do the major heart surgery that Bob previously described here (I think he referred to it as "non-trivial"), my personal opinion and preference is to get a unit that has never been opened up, manually soldered on in the field, etc. Only if a unit fails and I am into an out of warranty repair do I like to have my radios opened up.

Just my personal preference, as I'm absolutely sure that Kenwood's mods are just as good as the units that will eventually start shipping as G models from factory birth. Would not even have mentioned this, but it appeared that this gentleman thought he had a unit that was born a G model from Japan. From what Kenwood told me on the phone last week, I don't think this can quite yet be the case.

Larry

Rendered body type: text/plain

Jon,

It happens to me all the time.. When I am driving to and from work the APRS is beaconing ever 2 min. So the chance of the transmitter being on when I key the mic is great (even greater if you happen to have digi turned on!). Everyone on the repeater has figured it out now when they hear a dead carrier instead of my voice. You can test this for your self if you have a d7 . just beacon the d7 have the d700 in digi as soon as you see the d700 transmit key your mic and listen to your voice on a 2m meter voice channel you will hear no audio just a dead carrier. Un-key the mic and re-key and your voice will come out the ht as it should. "B" is APRS "A" radio is a 2m voice frequency say 146.52 for our test.

I just went out to the truck and made the test as above and it works as I said.. BUT if I switch the APRS to the "A" radio and voice on the "B" radio then the dead audio problem goes away! So this may be the reason why some people do not seen this problem!

So is everyone but me running APRS on the "A" radio? Guess I had better change the radio around..

No offence taken, thanks for making me take the time to switch the A, B radios to see if it made any difference. (I still think it's a bug in the firmware though).

Dwight

Seconded! I made a very long lead which was useless for hooking to a psion3a

until I shortened it a lot by wrapping it round a toroid. :) Bingo!

> Anyone having luck with a 'G and Garmin GPS's?   Is your 'G from a
> dealer or upgrade?

Yes. I have two upgraded G models - both work with my GPS III (not +).

There was one time (before the G upgrade) that the D7 refused to see the
data coming from the GPS. I'd get the flashing decimal points, but no
position. I ended up doing a _full reset_ of the D7, and that cured the
woes.

I don't know if this would matter, but had the GPS acquired a position when
you made your diagnosis? The behavior as to what constitutes a "valid GPS
position" may have changed a little with the upgrade.

Good luck!

Hi Ryan

I had a similar issue with my D7A(G) and my GPSIII+. The display would be
'flashing' indicating that it was getting data but it all stayed at zero's.
I found that by switching the D7' off and on whilst the GPS was connected
fixed it OK.

I also had a problem with sending waypoints to the GPS, however, much to my
chagrin, this turned out to be an intermittent connection on the pfranc
connector! Bussed out OK when I disconnected it but everytime I plugged it
in, no dice, took it apart and it was a poor joint due to that very thin
cable from Kenwood.

Tried it out last night on a run with the GPS and everything works fine.

Yes, I think the A radio is optimized for 2 meters and the B radio is
optimized for UHF. So I never even thought about running APRS on the B
side..

Thanks Jon....however, the D700 has what appears to be ONE large memory
band, so if you have memory channels programmed, no matter which "side" you
programmed them on and then do a memory recall and scan, it scans ALL
memorized channels.

As the other fellow pointed out, there are additional steps one has to go
through to get the D7A(g) to do the same thing. I haven't tried his
suggestion yet, but will look at it.

It wouldn't surprise me at all that the radio did not come from Japan
already modified, I guess. Thanks for the info. My goal was to receive a
radio that I would not have to immediately mail back to KW to get modified
and that goal was reached. Your goal is even loftier than mine (and you are
more patient), and I appreciate that perpective.

Thanks so much for your observation.

Thanks, I'll try that...the D700 works differently in that once a frq is in
memory, it doesn't matter what it was, when memory scanning ALL memorized
frq are scanned no matter what "side" they were programmed on. I'll try the
dual trick when I get a few minutes. 73

Two minutes sounds too frequent. I don't have my doumentation with me, so I
can't quote this directly. If I remember, the the proper transmission
interval should be more like 10 minutes, otherwise you will flood the net.

Subject: [htaprs] RE: D700 transmit "problem"

Jon,

 It happens to me all the time.. When I am driving to and from work the APRS
is beaconing ever 2 min. So the chance of the transmitter being on when I
key the mic is great (even greater if you happen to have digi turned on!).
Everyone on the repeater has figured it out now when they hear a dead
carrier instead of my voice. You can test this for your self if you have a
d7 . just beacon the d7 have the d700 in digi as soon as you see the d700
transmit key your mic and listen to your voice on a 2m meter voice channel
you will hear no audio just a dead carrier. Un-key the mic and re-key and
your voice will come out the ht as it should. "B" is APRS "A" radio is a 2m
voice frequency say 146.52 for our test.

I just went out to the truck and made the test as above and it works as I
said.. BUT if I switch the APRS to the "A" radio and voice on the "B" radio
then the dead audio problem goes away! So this may be the reason why some
people do not seen this problem!

 So is everyone but me running APRS on the "A" radio? Guess I had better
change the radio around..

 No offence taken, thanks for making me take the time to switch the A, B
radios to see if it made any difference. (I still think it's a bug in the
firmware though).

  Dwight

Dwight,

You've brought this up before. But I see it as quite statistically
insignificant. The odds of the TNC transmitting and you transmitting
simultaneously are very small. Additionally, the packet TX burst is so
short, it makes the collision of the two occurrences even less likely. I
don't think I've ever keyed up in the way you describe.

It doesn't mean there is a problem with the code or hardware of the radio.
I think it just doesn't happen often. You seem to be the only one who has
reported it and no one else to my knowledge has noticed it. I would call it
a very slight annoyance, the probability of which happening is very small.

I don't mean to be offensive in any way. I just don't see it happening very
often at all.

I don't know about 10 minutes, but adjust that to whatever your local
frequency can handle. I run APRS on the A side, for the reason stated that
the "filters" appear to work better on that VFO. Occasionally I run on the B
side, when I want to use the wide band capabilities to listen to 220 on the
A side. But usually I don't transmit while in this configuration. So unless
there is a reason to be on the B side, ie need the VHF wide band receive,
then move it over. I'll see if I can replicate your problem, I agree it
sounds like a bug.

Maybe I'm showing my ingnorance, but there is something happening that is perplexing. A friend of mine and I are sending packets back and forth on APRS. I am using WinAPRS 2.4.7 with my IC-821 and Paccomm NB96. He is using his D7G. That's the setup, here's the problem: after we send the packet and it is ack'd, the sending station continues to send the packet. Is this normal? I thought after the packet was ack'd, that was the end of it. I got a response last night, four times - it was ack'd the first time, but just kept coming. I'm also seeing stuff like ackK, ackL, etc. Any idea what those are?

Larry,

I've worked in a production lab as an integration test engineer, and the "heart surgery" described is very similar to the normal production firmware procedures for a new product. The only difference is that the screws are going to come out and then go back in.

As for the quality of the product post mod, I'm of a contrary opinion -- many "dead on arrival" radios will be removed from the shelves. Expect higher quality control on a modified radio.

Just 2 cents.

I think this depends on what the tracker is doing and
where he is at.. 10 minutes at 60/75 miles an hour???
At that speed @ 1 minute he would be outta your hair in
10 minutes, or you wouldn't have even known he was
there!! :-) IMHO

315. [htaprs] THD7A(G) transmit problems

From: Norman Huber <n9zks@earthlink.net>
Date: Wed, 21 Jun 2000 11:23:56 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92206-2000.06.21-11.28.20--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I set the APRS channel and DX-packet frequencies in and access them from
(f)B. We have very little activity on UHF so I want to keep the local 2
meter repeater up. I set the lockout to on for both of those channels,
manually tune to the APRS frequency and balance down on B and up on the
A side. When I go to the (f)B side it transmits and receives on the APRS
frequency, but it doesn't blow my helmet off with the packet audio. I
can then scan the 70 or so 2 meter frequencies I have in the 2 meter
side.
I do want to have access to the 70 cm side though, because there are
local repeaters I use. (One of our most active ARES groups uses UHF
exclusively.)
The only problem I've had is having the scan fail to continue after a
frequency clears when in areas of HIGH APRS use. I do believe that
collisions occur and confuse the processor when under heavy use.
My D7A does exhibit the problem of needing the two pushes of the button
to transmit if it was in the midst of processing an incoming packet.
Note though, that the same sort of thing happens in other cases. For
instance if you have just turned on the GPS and radio, and want to check
to see if the position is "complete" before turning Beacon on, you will
have to push Beacon twice or clear Position before the unit will take
the input.
As to another comment about beacon rate, I set my rate depending on my
mode of transportation. For instance, if I was leading a run, I would
use the shortest time I could so that the tracker would give accurate

position indication. For normal bicycle rides I'd like it to indicate my
position every mile or so. If I'm traveling across the country on my
motorcycle I'm just interested in my wife having access to information
as to my general progress. I might have to adjust if I was back in Bob's
neck of the woods. Of course when you are on the beltway in traffic, you
are moving slower than I usually move on my bicycle.

316. [htaprs] PG-4W Cable Requires Null Modem Adapter

From: "Larry Zanella" <larry.zanella@attws.com>
Date: Wed, 21 Jun 2000 11:43:3
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92212-2000.06.21-11.46.40--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The only way I can get my PG-4W cable to tone-out correctly against
Kenwood's PG-4W cable schematic is to use a null modem adapter (at the DB-9
end of the cable, obviously). For instance, when I interface my Garmin
GPS-35 PC to my D700 with the PG-4W cable, it works fine only if I use a
null modem adapter. But, when I look at Kenwood's schematic, this should
NOT be the case.

Has anyone else toned-out the PG-4W cable and found that Pins 2 and 3 (on
the DB-9 connector) are reversed compared to Kenwood's cable schematic?

Hard to believe, but I suppose I could have a defective PG-4W, as I have
only tried this one (new) cable, thus far.

Larry

I dug out my spec. This is quoted from V1.0 .

2. The objective is to have a net cycle time of 10 minutes for local use.
This
means that within 10 minutes of arrival on the scene, it is possible to
captured the entire tactical picture.
3. All stations, even fixed stations, should beacon their position at the
net
cycle time rate.

I suggest that users who need to send position updates more frequently
consider the impact of doing so. Though it may work fine in some uncrowded
areas, it may cause interference in other areas. It my be advisable to use
a private frequency, so as not to interfere with others.

I think this depends on what the tracker is doing and
where he is at.. 10 minutes at 60/75 miles an hour???
At that speed @ 1 minute he would be outta your hair in
10 minutes, or you wouldn't have even known he was
there!! :-) IMHO

Rendered body type: text/plain

The PG-4W is actually a cable to connect your TH-D7 to a computer, it is not
really a GPS cable. It is meant to connect an accessory (TH-D7) to your
computer. If you try to connect a TM-D700 to a gps (with your GPS to
computer cable and a PG-4W), you will need a null modem adapter to make the
two work together. This is "normal" unless you choose to make your own GPS
cable. If so, be very carefull when reading Kenwoods description of cable
connections. It is confusing. See the fine print:

Omigosh. Are you serious? This is surely NOT addressing GPS mobiles. Otherwise, what's the point? Why even have a tracker if someone won't even see you as you pass through their city?

> I suggest that users who need to send position updates more frequently
> consider the impact of doing so. Though it may work fine in some uncrowded

It is most advisable only to transmit when there is something that has changed. Your house doesn't move, so it should beacon at the net cycle rate. Timed rate beaconing for mobiles sends information at the wrong time, yielding excessive "spam" and a poor track at the same time. Corner-pegging and distance-pegging are a much better way, but unfortunately very few APRS versions/devices currently support them (APRS+SA, HamHUD).

> It my be advisable to use
> a private frequency, so as not to interfere with others.

I hope this sentiment is not heeded by others, because it will 1)
fragment the APRS network, and 2) render precious assets such as
digipeters and IGATEs unusable.

73,

Steve

Rendered body type: text/plain

Notice the use of the word "within" 10 minutes....depending on how your
network is populated, you certainly could send position more frequently than
10 minutes. I am aware of NO ONE who runs a tracker here beaconing any less
frequently than 5 minutes. Most of us are at 3 with a few at 2. It presents
no problems whatsoever.

Again...read the word "within"...that means NO MORE THAN, at least to me.
Yes, there is a point of diminishing return and network loading, to be sure.
However, using ONLY 10 minutes is, to my way of thinking an extreme
extrapolation, that would be reserved for only the most congested of
networks. Setting the position rate at 5 minutes also meets the spec of 10
minute net cycle time...in fact it EXCEEDS the "requirement". I think the
spec got interpreted backwards. The idea...at least the spirit of the idea,
is to have the entire network represented within 10 minutes. Setting things
no more than 10 minutes would accomplish this and so would setting position
reporting of mobiles at 5 or 4 or 3 ...assuming the network loading is not
problematic at these higher rates of transmission.

As always....there is NO ONE ANSWER to force down operators throats. To meet
the spec, pos rpt rate should not exceed 10 min. There is nothing (but
network loading) to prevent the pos rpt rate from being much shorter, esp
for mobiles making lots of turns.

On one extreme we have a "connect the dots" mentality of reporting every 30
sec. On the other end, is this reverse interpretation of "not more often
than 10 minutes". The happy medium is determined not by something in print,
but by the characteristics of your local network, including the number of
mobiles, their paths, their actual travel demographics, etc. etc. etc. This
is a LOCAL issue. ...and that is the context in which one should "consider
the impact".

Steve, I don't think you have to worry about this "sentiment" catching on. I
see no evidence that very many are going to adopt an absolute 10 minute
standard. Those areas suffering severe congestion might need to, but the
rest of us can set up to compliment our local network situation.

Interesting discussion, though!

73,

hasan schiers, N0AN
schiers@netins.net

The above is not quite correct. Yes, all 200 memories are contiguous, so
when you scroll through them, you'll see all the memories that the VFO can
display. Notice that the "right-hand VFO" cannot display/receive AM
aircraft band, so if you are in the "right-hand" VFO and scrolling through
the memories, you won't see the AM aircraft band memory channels.
Similarly, the "left-hand VFO" doesn't display/receive 1.2GHz, so you
won't see those while scrolling through the memories. Each VFO can display
multiple bands, but the VFOs cannot *both* display/receive *all* the
bands. One VFO displays/receives some, the other VFO the rest.

I disagree. If the TNC is beaconing every 30 seconds or so, it happens
quite frequently. If you are in QSO on a local repeater while beaconing,
it happens regularly... you press the PTT, you talk for 15-20 seconds,
release the PTT expecting the repeater's courtesy tone... only to hear
your the other party saying "Where did you go?". He didn't hear you
because you weren't transmitting.

I didn't write the spec. I assume that they did an analysis to determine
what kind of data rate the protocol will handle and based their net cycle
recommendation on that figure. I use their recommendation to set my
transmit interval to 10 minutes. If running at a significantly higer data
rate interferes with the operation of the net, then (the way I read it) you
are in violation of FCC regulations. Though you could probably listen to
the frequency and get a good idea how busy it is running in your local area,
you probably can't determine how far your repeated signal is being
transmitted. I doubt that you could determine if running a faster net cycle
would cause interference. If you really need a higher update rate, then you
are using the protocol for more than its intended purpose. Switching to a
private frequency for that purpose sounds like the proper thing to do.

Kenwood set the default cycle time to 3-minutes. I find this odd, since it
appears to violate the spec. Is everyone running at a 3-minute rep-rate?

Perhaps someone from the APRS Spec group could provide their comments?

Actually my original design objective was every 10 minutes for LOCAL
Operations. IE, A special event or local EOC or whatever.. We decided
that 30 minutes was about right for things beyond local. I thought that
distinction made it into the spec...

APRSdos and some othere try to defualt to this by sensing the path. If
the path that one is using is 1 hop or direct, then it sets the
net-cycle-time to 10 minutes (+/- many seconds of randomness). For 2
hops, it sets 20 minuets and for 3 hops or more, it sets it to 30
minteus. This way, even new-users who don know how to reconfigure, will
be ready at thte 10 minute rate if they are called upon to activate for
an emergency or local event...

Which is worse: 10 minute intervals with "RELAY,WIDE4-4" or 3 minute intervals
with "RELAY,WIDE"? How about: 12 second intervals in Ouray, Colorado, versus
10 minute intervals in Atlanta, Georgia?

The answer: it depends.

When I operate my D700 during my daily commute, my average speed is
around 65 miles an hour. In 10 minutes, I change position by over 10
miles. If one of my packets fails to make it into the system, my
position error as seen by the net could be over 20 miles. I estimate,
from empirical data, that one in three or one in four of my packets gets
digipeated during portions of my trip.

If my position in the net is in error by 20 miles, I might as well turn
off my tracker and simply beacon departure and arrival via fixed
stations at either end of the trip.

I fail to see how passing tactically relevant information could be
considered interference.

Hello All,

I'm looking for good information on getting started in APRS and Packet
Radio.

I'm having a hard time finding current how-to and best-practice types of
information.   The TAPR and APRS.NET websites both seem to point to mostly
older information, most of which is not beginner friendly.   I've gotten on
the air with several of the packages, but everything felt super-beta and

very "clunky". I have not found any worthwhile maps.

While some of my frustration has been caused by my StreetPilot getting stolen out of my car within days of getting a 7DA, I am having a hard time finding valuable online resources. I'd like to purchase another GPS and register whatever software works best. I would really like to see example APRS mobile and stationary setups and the pros/cons encountered.

My Primary goal with APRS would be to have my location available 24x7 on my website in a decent looking fashion (ie:not JavAPRS). I think that could be the trick to push several of my technical but not-to-impressed-by-hamradio friends to get a license so they could do the same. The CGI on www.aprs.net is exactly what I have in mind. Once I learn how to route my information to a internet gateway (if one exists in my area - Modesto CA) then I should have that goal achieved. Even tho I know I'm on the air local, I've never popped up on any of the APRS enabled web pages.

My biggest questions are probably more AX.25 related. I have not found any good explanations on routing or UNPROTO statements. What is the significance of APK001? Is that just telling people I run a 7DA and haven't changed the default? Are these UNPROTO statements registered somewhere or used by the receiving software somehow to parse my data? How do I find local paths to an Internet Gateway. Are there any current best-common-practices documents that I can reference? I see documents that say "never set your path as ..." but never a reason why. If there is a AX.25 source-routing commands document out there I'd probably be set.

My current equipment includes the D7A and Laptop running Windows 2000. I also have a Palm V sitting in a drawer that I could use if it would provide better on-screen visuals than whatever GPS I buy (the PalmV/Omnisky combo was obsolete by a Blackberry). I'm not too interested in getting another StreetPilot as the basemaps weren't that great and I wasn't about to spend more money on the mapping upgrades after being spoiled by Street Atlas. I'm considering the GPS III + since I still have a PC/Power cord however I would consider something smaller (even without a screen) if there is something that is the "hot setup" with the 7DA.

Anyhow, I'd like something that gives Street-Atlas quality mapping when on the laptop and something at least as nice as the basemaps on newer Garmins when using no PC.

I've installed the APRS+SA199YB beta, but it doesn't seem to be creating real-time maps very well. I'm running SA7 and I've seen APRS+SA draw a bunch of station icons up in the corner several times (in the wrong spot) when working with some of the menus manually, but it doesn't seem to be updating any real time data. It seems to be able to draw single stations no problem when I look them up. I'm also trying to register my location manually (since I don't have a GPS right now) by capturing my location from where I know I am on SA7 but when I then look myself up it shows me about 50 miles away. Is anyone else using APRS+SA/Win2K/SA7?

I'd use WinAPRS if someone could point me at a location with high-quality maps of California/Nevada.

Also, I'd be very interested in finding info about TCP/IP network technologies in Ham Radio. If I'm going to be dedicating a significant amount of computing power to mobile navigation, It'd be nice to get TCP/IP connectivity as well. With CableModems and DSL popping up everywhere it would seem that people would develop some sort of proxied TCP/IP data service that could allow hams to share their Internet feed with other mobile hams to provide "always available" (but understandably show) internet connectivity.

Any Feedback will be Appreciated!,
-Joe / K6JOE

> rate interferes with the operation of the net, then (the way I read it) you
> are in violation of FCC regulations.

Obviously, this sounds like some people in the packet radio community who think that actual, real use of a packet channel is QRM. There are more than enough people out there who think that a packet channel is only a good packet channel when there is no traffic on it. Any traffic they deem not important is QRM.

Richard, if you are transmitting every 10 minutes from your house YOU ARE QRMING the network! There is no need for a house or fixed station to transmit the same information over and over again. So why don't YOU think about the spec a little more instead of taking it so literally. Apply it where it makes sense.

A LOCAL operation is an operation that is specific to a certain purpose (ie: Special event).

Secondly, even transmitting your packet every 10 minutes is NOT a violation of FCC rules. Even if you transmit it every 10 seconds it isn't a violation of FCC rules. Why? Other people's modems have carrier detects and won't transmit while they hear you. So you aren't intentionally causing interference. Are you clogging the network unnecessarily? Sure, but you aren't violating any rules. So don't you dare try to say that mobiles who transmit every 2 or 3 minutes violate FCC rules.

> Though you could probably listen to
> the frequency and get a good idea how busy it is running in your local area,

> private frequency for that purpose sounds like the proper thing to do.

So I supposed in your view if my buddy who lives across town and I engage in sending messages to each other, we are QRMing the frequency since we are having a QSO on the APRS channel. Well, we aren't. We are using it for what it should be used for.
>
> Kenwood set the default cycle time to 3-minutes. I find this odd, since it
> appears to violate the spec. Is everyone running at a 3-minute rep-rate?

The spec isn't written in stone! NO WE ARE NOT ALL RUNNING A 3 MINUTE RATE! DOH! If 10 minutes was set in stone as you think it is, then I don't think the APRS authors (who had a LOT of input into the design of the Kenwood radios) would have allowed anything other than 10 minute interavals!

Again, if you are running your home station with anything less than 30 minute beacon intervals, you are transmitting too often! If you are running your mobile with anything more than three minutes you aren't transmitting enough!

What is worse: 30 fixed stations transmitting every 10 minutes (the SAME INFO) or 15 mobile stations transmitting constantly different and new data every 2 minutes? I think those 30 fixed stations would do a LOT of good by transmitting every 30 or even 45 to 60 minutes.

Think before you arbitrarily start whining about a spec.

>

Hey Dwight, this could be why I've never seen it!

> So is everyone but me running APRS on the "A" radio? Guess I had better
> change the radio around..

I think most run APRS on the A band. Another thing is I think you are using
2 meters for voice as well as APRS. There could be some issue with VCO
switching times and so forth with your configuration. I don't know the
internal details of the radio, but I would suspect it's probably a hardware
limitation and not a software one. I wish that I could run UHF on band A
(where I gab most) and VHF on band B, but I can't. Such is life! I would
recommend you swap the data band.

That's probably why no one else has seen it. I can try it out to see what
you are saying though. I'll let you know.

331. [htaprs] RE: APRS Transmit Intervals

From: "Herb Gerhardt, KB7UVC" <gerhardt@hctc.com>
Date: Wed, 21 Jun 2000 21:49:00 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92313-2000.06.21-23.52.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We here in the NW APRS Group recommend, and I said recommend, that the APRS
stations in our area transmit as follows:

For Home or Stationary Stations	Every 30 Minutes
For Mobile or Moving Trackers	Every 2 Minutes

These are our recommendations and are the settings that I personally use and
they seem to work quite well for having everyone displayed on our network.
No, not all of the APRS users in our area follow these suggestions. That is
OK too. We are not an enforcement group and just try to give suggestions in
order to keep order in our system which seems to work extremely well.

So, if you are undecided as to what your APRS transmit intervals should be,
give the above a try and see how it works for you. In different areas and
for specific events, there might be reasons why you would want to transmit
more or less often.

Incidentally, I love the messaging capability of APRS. The way to keep your
traffic from clogging the system, is to use an alternate path for the
station you are "talking" to, i.e., if you can hit the other station
directly, don't send the message to WIDE or WIDE5-5. Just use the other
stations call sign in your alternate path or the minimum path required to
hit that station.

Lets not bicker. Lets all enjoy APRS. I sure do.

This is something I've always wanted to do, Herb, but I don't think it can
be "easily" done unless you are running your TNC in KISS mode. Perhaps I am
wrong on this.

I've had a lot of problems getting KISS mode to work right with my KPC-3+.
Sometimes it works and sometimes it doesn't, so usually I don't even bother
with it.

Have you figured out how to make it work?

Thanks and 73,

Hi,

        I noticed that my Pharos GPS works with my TH-7A but not with my
D700. In this case it might have something to do
with the operating voltage level (RS232 levels). I might try running it at a
slightly higher battery voltage to see what happens.

David,

There are two software packages that will download a file from the VC-H1.
First one is Kenwood VC-IS written by AOR. Priced at $29.95.
A real piece of CRAP, I don't recommend it..

The next is Kenwood KCT-24S, looks like the above but does enable you to

upload and down load picture files to the VC-H1. Priced at 58.95.

Both are available from Amateur Radio Electronics 1-800-558-0411

The simple way to get your picture file is to transmit to a PC with SSTV
software and save the file. Check http://www.sstvham.com for more info on
the Kenwood VC-H1.

In APRSdos, to use an alternate path for each message, just put .../XX
after the call on the TOLINE. Then that message will be sent via the path
on your DIGIPATH list labeled as "XX"...

Bob Bruninga mentions on his ASTARS page that Internet messaging is available via satellite.

Is it also available on terrestrial APRS ??

I attempted to send an E-Mail message to myself. I addressed it to "EMAIL" with my E-Mail address listed
 first in the text line. I had a good connect with the national net (my station and icon were displayed
on the APRS.net). I never received the message.

We are just getting started here in western Alabama with APRS and are trying to "learn the ropes".

Thanks,

Don DeJarnette

Subject: APRS REPORT VIA UO-22

Hi Bob:
Very nice APRS report this morning at 8:50AM via UO-22.
I was with my little D7A(G) and a diamond SRH-519
(21cm!!!) drinking a coffee in the beach.
I received:

WB4APR-3
TM-D700 Special (van icon)
pse qsl! sat test!
FM19QD
1324 Km
N 39' 09.00'
S 076' 36.00'

I'll come back to Europe next June 30th. I'll continue
my APRS tests there with my friends of "Francisco de
Orellana" ham-radio club in Badajoz (Spain). We have
several TH-D7E and TM-D700.
THANKS BOB!!!
Pedro, EB4DKA. Vero Beach-FL.

Might I suggest that trackers reset their rep rates to 60 minutes when parked, or better, turn the radio off.

Any given moment, it seems almost all the 'tracked' stations are immobile. They clutter the screen while hunting for MOVING stations.

While it's fun to see stations moving around, that seldom happens, relative to the 'trackers' that are parked. Some parked stations seem to have direction and motion :)

Anyway, map clutter is already overwhelming for those of us who watch large areas and aren't just looking for a particular event. The clutter makes it more difficult to explain to non-hams what is of value on the display.

Be nice when we can select EACH category we wish to see, particularly as more categories are developed and custom varies around the planet. Meantime, it would be great if non-moving stations of all types transmitted as least as possible (I think).

I kinda wonder why a mobile station that isn't moving, transmitting important stuff (as perhaps digi'ing if necessary) or doing some other real work MUST be transmitted at all? I mean, besides being able and legal and having spent all that money and all that? Seems non-productive from here.

Perhaps if stopped 'tracker' stations could change their status from 'trackable' to 'fixed station at the moment' and not appear on the 'tracked only' map? That would help the cluttered 'tracked' display.

Be nice to eliminate nodes, wx stations, and other categories at will to hone the display to specifics. Right now, 'flagged stations only' with no flagged stations gives a clear map for wx display, but it'd be nice to be able to selectively add categories without having to know their calls in advance. One new category could be 'non-moving stations'.

343. [htaprs] Duplicate MicE positions

From: Bill Diaz <billdiaz@megsinet.net>
Date: Thu, 22 Jun 2000 10:14:49 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92403-2000.06.22-10.18.45--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is a sequence of locations that appeared on the Internet feed this
morning. 5 packets seem to be generated for every raw MicE packet transmitted
by KB2EAR-15. This sequence repeats about once a minute. APD212 dupes are not
being detected and this may be due to the asterisk appended to the originating

call sign. Other dupes are not detected due to differences in time stamps,
locations, and the formatting of information after the speed field.

The Local RF channel would be swamped if several mobiles were sending MicE
packets at one minute intervals within the same RF coverage area as KB2EAR-15.
 This would most likely happen during a special event, or disaster and could
render the local APRS network incapable of providing timely and accurate
information.

344. [htaprs] D7 Upgrade Turn Around

From: KC2EAW@aol.com
Date: Thu, 22 Jun 2000 12:03:15 EDT
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92414-2000.06.22-11.07.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Thursday of Last week (6/15/00) I shipped my D7 to Kenwood's Virginia
Beach Center for the "G" upgrade. They received the unit on Monday 6/19.
Tuesday 6/20 at 4:22 pm I received an e-mail from their UPS Software that
the radio was shipped back to me that day. The e-mail included a tracking
number. Sure enough my radio was delivered today. I just went through it
to check out the new features and reprogram the APRS functions.

In short I'm very impressed. 24 Hour Turnaround! Way to go Kenwood!

345. [htaprs] D7A(g) Deletion of Single Msg?

From: "hasan schiers" <schiers@netins.net>
Date: Thu, 22 Jun 2000 13:17:02 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92420-2000.06.22-13.20.50--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hmmmm..can't find this one in the manual either. How do you delete just one
message in the message list of the D7A(G) HT? If I press and hold A/B, I get
a prompt to delete all messages. How does one delete a single message?

BTW...thanks to all on the VHF/UHF scanning question. It works much
differently in practice with the D700 (which I was used to) than in the D7A.
I now can scan VHF and UHF...it just takes a few additional key strokes.

We were having the same problem with KC4ZPL-14, here in central Iowa. The
local Igate, N0BKB is picking up from the internet and we were getting 15
packets in a row all from the same station, over and over and over and over
again. (ad nauseum). We have removed this station from the stations.txt list
and the problem disappeared.

Please don't take this to be a criticism of zpl....it may have absolutely
nothing to do with him, but it idoes sound like it is connected to the
problem mentioned w/r to ear-15 below.

Our local network is relatively uncrowded. Lots of activity, just not busy
all the time. With zpl-14 on, it was literally taking over the freq for 15
or 20 sec at a time nearly every minute or two. When we stopped gating that
call, I made some short observations and noticed that there are typically 25
to 35 seconds of dead air each minute...obviously nice...yet quite active.

347. [htaprs] Re: D7 Upgrade Turn Around

```
From: John Gorkos <jgorkos@CellNet.com>
Date: Thu, 22 Jun 2000 13:24:54 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-92424-2000.06.22-13.28.46--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

Unfortunately, I chose the West Coast Facility for my upgrade. My first mistake was shipping UPS ground instead of blue or red. My D7A was dropped off at the Lenexa, KS UPS facility at 11:00 AM on 2 June and was not delivered to Cerritos until 9:30 on 8 June. A call to the facility today told me that the unit was sent to to repair center from the warehouse on June 16th, 8 days AFTER the warehouse got it. The Kenwood representive told me that they were receiving "1000's of radios per day" and that turn-around time was 10-14 working days from the date of receipt. Since my radio was not received until the 16th (even though Mr/Mrs. Briseno signed for it on the 8th), she told me it would be 10-14 business days to get it upgraded.

NEWS FLASH: I just received a phone call from Marie in the service center (what timing...). She told me the radio is done, and needed to get my payment information (even though I enclosed it on a signed letter in the original box I shipped the radio in). She DID let me upgrade the shipping to UPS Red (she was going to ship it Ground).
I don't know if my two phone calls to Kenwood pestered them into pushing my radio through the system faster, or if my number was just up, but I would recommend that anyone east of the Rockies ship their D7 to the east coast facility and avoid getting caught up in the "1000's of radios" received daily in California.

Despite my irritation that it took 8 days for my radio to make it to the repair facility from whatever "warehouse" originally got it, and another 6 days to get the upgrade done, Kenwood DOES get credit for being able to tell me where my radio was when I asked, and credit for just plain upgrading these radios instead of saying "buy a new radio if you want the new features." They did make it within the 10-14 business days they promised, but nothing like the other stories I'm reading on this sig...

Good morning,
My radio is down in the car, but I believe that if you just press and
release A/B once, it'll give you the option of deleting the current
message, without a confirmation. Press it twice and it'll allow you to
delete them all, requring a confirmation.

-David

I have reversed the "A" "B" radio and the problem went away. You just can
not put the tnc on the "B" radio and not have your audio go dead on you if
the tnc is transmitting when you press the mic button.

Richard,

 I have a 20 min. drive to work, so a ten min cycle would not work at all
for me. I would have one beacon when the radio is turned on (if the GPS was
in lock yet, no likely) one ten minutes later and one more if I remembered
to hit the beacon button just as I turned off the radio. So only one or two
beacons would show up on the map. If I was in a bad RF zone during that time
I might not show up at all. This is not what I wanted when I funded and
built the internet gateway and wide digi in Bloomington Indiana.

 By building and maintain the Bloomington system and talking to hams on the
voice repeaters on my way back and forth to work I have caused many hams to
get interested in APRS (Two D700 and about Five D7's worth of interest) In
fact I have two non-hams now studying for their licenses just because of
seeing my mobile on the internet every day!

I agree that stationary stations, like my house and my parked mobile beacon
only every 30 min.

 Do you agree that a slow moving mobile driving on city streets has to
beacon at a higher rate that a mobile on the interstate driving between
cities to generate good tracks on the map?

  Dwight

Rendered body type: text/plain

Hi folks,

Sunsat digipeating is enabled overnight (until 23 June, 04:30 UTC).
No bulletins or telemetry is transmitted. Sunsat will perform all
kinds of manoeuvres during this period. It might influence your
uplink success in particular. The uplink is 436.291 MHz (both 1k2
and 9k6), the downlink 145.825 MHz (only 1k2 this time around).

Kind regards,
Johann, ZR1CBC

Rendered body type: text/plain

Hasan,
  The likely causes of the server not detecting duplicate packets include :
1. Some TNC's append an asterisk to the originating call of a station heard
locally.

2. IGATE time stamps are different.
3. Converted MicE locations differ among IGATES
4. Each IGATE application adds differing text after the speed field of the converted packet.
5. Some IGATES are truncating packets at 100 bytes.

Obviously, dupe detection is defeated when multiple IGATES convert the same MicE packet differently. It is certainly not the fault of the MicE station. The fault lies almost entirely with the IGATES.

When converting a single MicE packet, all IGATES should create an identical information field including the timestamp.
We need a standard for converted MicE packets. Until this is created and adhered to, expect duplicate packets, wasted bandwidth, and corrupted vehicle tracks.

Unfortunately, KC4ZPL-14 must suffer since the lack of a standard for converting MicE packets has flooded your local network with unnecessary and in some cases erroneous locations from his station.

If you're talking about timed beacons alone, absolutely. On
interstate highways, the information rate is very low; mostly,
you're going straight. The beacon rate at low speeds has to
be a lot higher to effective communicate the vehicle's track.

A better way, though, is to use timed beacons in association
with "corner-pegging" beacons. That is to say, beaconing
when a turn is made will produce a superior track at low
speeds than will a timed beacon alone. In fact, that's why
I've designed the HamHUD device to operate just this way.

I wish that other APRS-type devices would implement this. Is
it too much to hope for in a future TH-D7a upgrade? :-)

73,

Steve Bragg KA9MVA

Having had these questions myself, and reading the various threads here
and on the California list regarding beaconing rates, I think the
operative term here is "common sense". (Unfortunately, different people's
common sense sometimes lack a common denominator :-)).

Especially on a crowded network, it seems to me that beacon rate should be
set on an analysis of several other things; the unproto path you want to
use, the kind of roads you are on, the average speed you think you'll be
traveling, and the length of the trip.

Around town, once every few minutes or more might be OK. OTOH, on the
interstate or freeway, at 60 or 70 miles per hour, every minute might
work. I try to shoot for a posit per per mile or so. I really would like
to see adaptive stations that automatically change rate based on speed.

My commute is about 7 minutes, so even if I send a posit every minute, I'm
only putting a few packets out in one trip, and the D700 turns off with
the ignition.

That's not to say that there aren't special circumstances. When I tractor
mow, I sometimes take my D7 and GPS along, set the power low, the path to
my home station only, and the rate to 30 seconds. That's as quick as the
D7 will send. But I'm running really low power, and not being digipeated
anywhere.

My fixed stations, though, I set to beacon every few hours. I figure I'll
be seen by other fixed stations, and that's all I really care about. If I
was expecting a mobile to be using APRS to find my house, I'd speed up the
rate.

I know this isn't an easy answer to the newbie who just wants to have
someone tell him a pat answer to the posit rate question.

Maybe we could tell them something like "try to averge no more than one
posit per mile, and set your rate accordingly" or something like that.

Chris

Rendered body type: text/plain

It's not up to me to agree. I apparently sound as if I'm trying to police the airwaves, which is not my intention. I originally mentioned the 10 minute rate because of a thread relating to a quirk in the D700 when you try to key down during an APRS transmission. This has rarely happened to me because I use a 10 minute rate. When I sent my first reply to this thread, I assumed that I was helping someone avoid D700 problems because he/she had selected too short a transmit interval. The way I interpreted the spec, it seemed clear that the correct transmit interval is 10 minutes. I had assumed that this was based on some kind of analysis of expected network traffic. Perhaps I am taking the spec too literal.

Given that one position update repeats several times, and the very low data rate for the protocol, it is clear that it would be easy to overload the system. If my relatively rare position update doesn't get out due to collisions with other operators who chose a higher update rate, this would seem unfair to me. If someone chooses a very high update rate (the D700 can do 12 seconds), thereby flooding the network with their position, I would consider it malicious. At what rate saturation occurs would be hard to calculate. My guess is that if a half dozen users in one area selected update rates of a half-minute or less, they would start to overload the net. Given that position reports are repeated, are we not talking about a pretty big area? If someone else wants to take a crack at the calculations, please do so. APRS is becoming very popular. It is only a matter of time before this becomes an issue. If the spec authors really didn't mean 10 minutes, then what did they mean?

regards
Rich

Subject: RE: [htaprs] Re: net cycle time (was D700 transmit "problem")

Richard,

I have a 20 min. drive to work, so a ten min cycle would not work at all for me. I would have one beacon when the radio is turned on (if the GPS was in lock yet, no likely) one ten minutes later and one more if I remembered to hit the beacon button just as I turned off the radio. So only one or two beacons would show up on the map. If I was in a bad RF zone during that time I might not show up at all. This is not what I wanted when I funded and built the internet gateway and wide digi in Bloomington Indiana.

By building and maintain the Bloomington system and talking to hams on the voice repeaters on my way back and forth to work I have caused many hams to get interested in APRS (Two D700 and about Five D7's worth of interest) In fact I have two non-hams now studying for their licenses just because of seeing my mobile on the internet every day!

I agree that stationary stations, like my house and my parked mobile beacon only every 30 min.

Do you agree that a slow moving mobile driving on city streets has to beacon at a higher rate that a mobile on the interstate driving between cities to generate good tracks on the map?

Message-ID: <LYR845-92463-2000.06.22-16.40.36--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

NEWS FLASH (MAYBE)

In preparation for possible 1200 baud standard APRS for fielday, there will be a test tonight of SUNSAT at these times (I hope I predicted these right!):

PDT	CDT	EDT
		1843 (very low to east, even on east coast)
	1921	2021
1900	2100	2200
2040	2240	

Just use NORMAL APRS but tune to the 145.825 downlink 1200 baud.
If you have a dual band rig, then TRANSIT on 436.280, .285, .290, .295, .300 as the pass progresses.

Do NOT hog it. SHorten your packets.
Use the path of VIA SUNSAT

This should be FUN!

de WB4APR, Bob

Boy, great response. We support the County fire department with
communications on large fires and other major incidents. We need a station
for our Comm Support Unit in the field, but use for APRS would be good also.
Thanks again for all of your help.

>
> We are just getting started here in western Alabama with APRS and are trying
> to "learn the ropes".

Well, first of all, you need an iGate in your area that can hear your
packets. You said that you could see your icon on the "APRS.net" so I am
assuming your home station at least is in earshot of an iGate.

I am not sure but I think the iGate has to be enabled to forward the e-mail.
Don't quote me on it. That may be incorrect.

Lastly, the system IS hit or miss right now. Your packet has to be heard by
the iGate, then it has to make it up to the EMAIL server connected up to one
of the Sproul brothers computers in NJ. If all is well and the e-mail
server is up and running, it will then get the message out into the
internet.

It seems to work about 50% to 75% of the time.

I hope this helps. Keep trying.

Rendered body type: text/plain

I shipped the radio by UPS Ground on Friday the 9th. UPS reported delivery
in Virginia on Monday the 12th.

On Monday 6/19 I called the shop to ask about a status, and was told that
the unit was received but had not yet been assignd to a technician. But the
assignment should happed "by the end of the week".

On Tuesday 6/20 UPS sent an email notifying me that the unit had been
received for shipping, and the radio was delivered to my door on Wednesday
6/21. That made for a total turnaround of just under two weeks. I'm happy.

Don't know if the call about the upgrade status affected the almost
immediate turnaround from that point on.

Kenwood ended up billing $68.75 ($60 + $8.75) plus the $5.35 I spent to ship
to the service center for a total upgrade cost of $74.10.

All I got in the return box was the radio, a reciept, and a notice about how
to inspect for and report damage. Nothing about available software.

Darrell

Chris,
I'm running mine with 3, 1.5V batteries, maybe that is the problem.
I think
5.5 volts is max. The batteries and the TH-7A work great for portable use
but with
the D700, a regulator (5.5V) in a cigarette lighter plug and the Pharos GPS
would be an
acceptabable combination for in the car.

Thanks,
Paul
WB6IWT

Are we tired of hearing of upgrade successes? The overwhelming opinion
seems to be enthusiastic; mine, too.

I live local to the west coast Kenwood repair center, so I brought my HT
in Friday at noon. They phoned next Monday noon to tell me the unit was
ready. I had an upgrade certificate from Dayton (yes, I had actually not
brought my HT to Dayton!). Kenwood provided the upgrade and new manual
free. No shipping charges and only some gas for driving perhaps 15
miles.

Is this great service? Thanks, Kenwood!

---------- Forwarded message ----------
Date: Fri, 23 Jun 2000 00:22:17 -1300
From: pedro perez <papac@mixmail.com>

Hi Bob:
This morning in the 8:10am pass of UO-22 (28 degrees
max elev.), I worked APRS digipeating with my D7A(G)
and a dual band whip (MFJ 1717) INDOOR!!!
"MY POSITION" appeared many times in the display when
I transmitted my signal.It demonstrates that this is a
very reliable message system!
Also, I have a little question. Can I send shorts E-
mails via APRS network? If it is possible, how can do
it with my D7? (I have seen your web page and I think
it is possible).
SINCERELY. Pedro, EB4DKA.(EL97TP)

Yes, just send an APRS mesage to EMAIL and in the message make the first
word of the message be the full email address. Thus you are limited to a
very short message of what remains on the line...

Read the information again! ;-)

"NTERNAL TNC FOR PACKET AND APRS"

This radio does not have the built-in APRS software and or the DX Packet
Cluster software like the Kenwood radios.

Does anyone have the correct wiring diagram from the Kenwood cable to the Garmin connector.

I tried the KG7IL diagram and it was incorrect (the red wire connects to ring, not tip as shown).

Rendered body type: text/plain

Good morning,

I used the following page to hook up my D7A(G) to my Garmin 12 the other night.

http://kg7il.foxinternet.net/ham/aprs/45xl-d7a.htm

This is the same page you looked at, and it worked for me. I just used the
cable that came with the D7A, which wasn't the best quality but had the
right tip on it. If I remember correctly, the white wire was yellow coming
out of the Garmin cable.

I clipped the conector off of a Garmin data cable to make mine.

However, the simple addition of a HamHUD to this radio would make it a
full-function APRS-type station.

You're probably right about 2 min being
too frequent, for a lot of areas.

What may be appropriate for my local area
might not work at all in yours. My nation
wide travels continue to prove...

Each APRS Region is Different!

2 minutes wouldn't bother Rex (the only
aprs head in Montana) at all...;-)

Rendered body type: text/plain

Hi folks,

The flight software has changed quite a bit over the past two weeks,
causing us to experience the teething problems of earlier this year
all over again. A safety mechanism, which ensures transmitter
shutdown, was left enabled inadvertently. It disabled digipeating
after our final evening pass yesterday. Imagine trying to operate
your rig when all knobs change function every few days. ;-)

Sunsat's digital and voice modes will be active until June 25, 16:00
UTC. In its digital mode no bulletins or telemetry is transmitted.
Digipeat via SUNSAT or APRSAT. The uplink is 436.291 MHz (both 1k2
and 9k6), the downlink 145.825 MHz (only 1k2 this time around). The
weekend schedule for the voice passes is as follows (times are UTC):

Australasia	24/6 08:18
Japan	24/6 09:38
South-Eastern Asia	24/6 11:22
Southern Africa	24/6 16:37
Europe	24/6 17:55
South America	24/6 23:10

North America   25/6 02:17

Please provide feedback on whether digipeating was successful. We
are busy with other experiments at this stage and did not have the
opportunity to verify that Sunsat switches back to digital after a
voice pass. For what it's worth, I got digipeated tonight, using a
Kenwood TH-D7A, with Sunsat at 3 degrees elevation!

Kind regards,
Johann, ZR1CBC

Joe Cram wrote:
> I'm looking for good information on getting
> started in APRS and Packet Radio...

You've posed a good bunch of questions. I'll
confine my comments to your questions re:

> ...I have not found any good explanations
> on routing or UNPROTO statements...

I always suggest the best way to discover what
UI path works well for your individual area
is to experiment. It might take a few days
but you will likely have a cleaner (less dupes)
output and cause less congestion if you take
the time to experiment. Besides NO ONE else
can tell you what your best path should be.
It is different for you than it is for a
ham 6 blocks away.

To experiment, let's first take for granted that
the experimenter knows the basics of using the
terms RELAY, WIDE, WIDEn-n. TRACE and TRACEn-n.

I begin experimenting in a new location by setting
my path to something like TRACE3-3 and let the
station run for a while. Make some contacts, ping
some stations, 'play' the software for a while.

Then examine your send/received packets. You'll begin
to see the local digi that appears biggest/strongest.
Once you know that, substitute that digi call sign for
the first place in your UI path. ie start with -
TRACE5-5 then modify to
K5XXX-5,TRACE4-4 (K5XXX-5 is a made up call, of course).

Now your path will hit K5XXX-5 first. Examine your in/outgoing
packets and messages and if you can see a second digi that
seems to be a logical choice for the second digi hop,
substitute that digi for the second place. ie
K5XXX-5,K5YYY-5,TRACE3-3.

Once you think you have discovered a logical path,
replace the TRACE statement with WIDE. ie
K5XXX-5,K5YYY-5,WIDE3-3 (wide results in shorter
packets than trace).

If your area doesn't support TRACEn-n then you can use
other generic calls like WIDE etc.

The end result would theoretically be a path with one

or more 'real' call signs in the path, perhaps ended
with something like WIDE or WIDEn-n.

MOST IMPORTANT to remember, I think...APRS systems and
local networks vary immensely from one area to the next.
An approach that works perfectly in one area might really
suck in the next area. They're all different.

Richard Carter wrote:

> ...I originally mentioned the 10 minute rate...
> ...The way I interpreted the spec, it seemed clear
> that the correct transmit interval is 10 minutes...
> ...Perhaps I am taking the spec too literal...

Richard, I suggest you are reading the spec backwards.
The spec suggests that if we were to set up a tactical
APRS station, we should be able to get a good local
picture WITHIN 10 minutes. That suggests that all
relevant stations should beacon AT LEAST 10 min
OR FASTER. I don't think the spec is suggesting
at all that mobile beacons should be set to
10 minutes. ie 1 posit Q/10 min would be
the SLOWEST beacon rate.

In our fairly busy network (the eastern slope
of the Rocky Mtns) mobiles may run 2-3 min
posit beacons with no damage to the system.
Our bases tend to have reasonably long timing
(20min, 30min, 1hr), the WX stations seem to
have the longest and that all tolerates
frequent mobiles with ease.

Experimenting is the best way (IMHO) to
discover what works in your local area.

Rendered body type: text/plain

Here is a one line summary of currently active FM birds that you can
receive on your Mobile FM rig and mobile vertical whip antenna.
New items:
 1) SUNSAT is enabled for 1200 baud APRS UI Digipeating except
    during Voice passes.

SAT	DOWNLNK	UPLINK	S	MODE	COMMENTS
MIR	145.985	145.985	9	S FM crew voice	Off

```
UO11  145.825         4 R FM Bell202 ASCII Telemetry only
UO14  435.070 145.975 5 J FM Voice rptr    lots of fun every pass
AO27  436.795 145.850 3 J FM Voice rptr    days only but fun
SO35  145.825 436.290 8 B FM Voice rptr    On once a day
SO35  145.825 436.290 8 B 1200 bd AFSK     APRS Digipeating
UO22  435.120 145.900 3 J 9600 bd FSK BBS  ON
KO23  435.170 145.900 4 J 9600 bd FSK BBS  ON usually
KO25  436.500 145.980 3 J 9600 bd FSK BBS  ON
TO31  436.925 145.925 5 J 9600 bd FSK DATA ON downlinks images

* If you dont hear it, then DONT TRANSMIT!  EIther the bird is dead
  or your station is deaf.  Don't embarass yourself and QRM everyone.

Between the hours of about 6 AM to noon and 6 PM to midnight local SUN
time there is usually one of these birds in view for a few minutes to keep
you entertained while traveling.  UHF requires +/- 5 or 10 KHz Doppler
tuning.  The "S" column is a subjective signal strength assessment.  A
20" vertical whip in the center of your car roof  will give you success as
shown below.  This acts as a 3/4 wave on UHF giving almost 8 dBi above
30 degrees over a good groundplane for the UHF downlink birds.  For
SUNSAT which operates mode B with a stronger 2m downlink and your 50 watt
mobile uplink, a normal dual-band mobile antenna will do better closer
to the horizon.
                                              SIG RECEIVE RANGE
USING THE 20" WHIP FOR MODE J PACSATS:        --- ------------------
As a rough approximation consider this table   9  Horizon to Horizon
which  I have subjectively  determined after   8  5  deg and above
3 months  of daily monitoring. Home stations   7  10 deg and above
with 50' of RG 8  should subtract abt 3 from   6  15 deg and above
the signals and 5/8  or dual band, or "gain"    5  20 deg and above
antennas  should also subtract about 2.        4  25 deg and above
                                               3  30 deg and above
The PACSATs  do not  officially digipeat  UI   2  3 ele beam required
packets,  but  you can still  see status and    1  6 ele beam required
telemetry and the USER lists on your Kenwood
data radios or any radio with 9600 baud TNC.  For more info on mobile
satellite operations see http://web.usna.navy.mil/~bruninga/astars.html

Errors, omissions, corrections welcome.  I will re-post this when ever I
hear of changes in status.  For more detail, of course, read the AMSAT
News Service bulletins and AMSAT WEB pages http://www.amsat.org

Hello,

Well my radio was sent off on friday, June 2, and received on June 6. I called
up for status last friday (2 week point) and it was still on the shelf. When
I called up today (3 week point) a tech was looking at it. The person I
talked to had no idea when it will be finished. I hope it will be shipped
back next week sometime.

That is correct. I took a look at it at Dayton. Basically, it's a radio
with a TNC built in. That's about it. You feed the GPS data into the port
in the front. But in order to set up the radio to beacon, etc. you need to
connect a computer up to the serial port on the rear of the radio. Then you
program up your TNC just like you would any other TNC. Once done, remove
the computer and you have a dumb tracker in one package.

It's not a bad radio and it certainly is a lot cheaper than a TM-D700A.
However, I don't know if you can beat a TM-D700A for a mobile APRS set up.
There is nothing quite like it. And you get a second band to boot (the
Alinco is 2m only).

If you want the features of a TM-D700A or TH-D7G, the Alinco is not a cheap
alternative. If you want a dumb tracker in a small, convenient package,
then think about the Alinco.

I just went to the site. The TM-D700A software is still the Beta version.
Perhaps I jumped to soon?

I've been sending out APRSDATA for a while now and decided now was the time
to actually monitor one of these birds!

Caught the SUNSAT pass this evening and caught three stations here in NJ:

WB4APR-9
N4ZQ
N3KTP-3

I was very impressed by the signals through a cheapie MFJ magmount on the
car roof into my D7A. I even caught a few packets with the supplied rubber
duck/dummy load!

Now if I can figure out how to make this thing uplink...

Rendered body type: text/plain

During tonight's passes and hopefully some on FIeld Day, SUNSAT is in 1200
baud AX.25 packet mode for UI digipeating (No connects please!). ANyone
with a TNC and 2m FM radio can receive SUNSAT downlink on 145.825.
If you run APRS software then you will see everyone plotted on the map and
capture all messages. Otherwise just operate in dumb terminal mode.

TO transmit, uplink 1200 baud AFSK on 436.280 at AOS and then move up
through 436.290 in cener of pass and ending at 436.300 at LOS. DIgipeat
via the path of SUNSAT or APRSAT.

Once you see yourself in the downlink a few times, BACKOFF and let
someone else in... Everyone else will have captured you too...

de WB4APR, Bob

In connecting the Garmin GPS-35 PC (with DB-9 connector) to my D700, the
tip and ring are reversed in Kenwood's documentation for the PG-4W cable.
You have to use a null modem adapter!

The T7 G programming software will allow a PC to input memory channels,
etc. However, it does NOT support any of the new G features! For example,
the G model supports 3 My Positions (as opposed to 5 on the D 700). This G
version programming software supports only ONE My Position, just like the
old radio. So far, every single new feature of the G model that I have
tried appears to NOT be supported by this PC programming software.

What gives?????

I've tried to just listen to SUNSAT for the last couple of weeks, with no
success. I just tune a receiver to 145.825 FM squelch open and heard
nothing. :(I'm using the Linux program PREDICT to figure out when the
passes occur. I've also attempted to listen to other satellites that Bob
listed in an earlier e-mail as receivable by a mobile. I'm using an
Isopole with an IC-746.

I tried compiling SatTrack, which failed miserably. Eventually I'll break
down and install DOS on a 486 so I can run APRStk and get the bulletins on
my D7A, but until then -- anyone know what I could do to accurately predict
the sat passes (and works in Linux?)?

SUNSAT has been OFF for the last couple of weeks due to sun heating. But
as of last night it is on again for Fielday. Next pass is at 1235z
Saturday Morning over the east coast. COmpare your software predicts to
that.

Oh yes, this time it is 1200 baud NORMAL APRS!
EVERYONE with APRS can receive it on 145.825.

bob

>I've tried to just listen to SUNSAT for the last couple of weeks, with no
>success. I just tune a receiver to 145.825 FM squelch open and heard
>nothing. :(

SUNSAT has not been transmitting for the last few weeks due to its current

orbit that is making thermal management more "interesting". Apparently the
ground controllers have only started trying to setup digipeating in the last
few days to support field day (I assume that they found time to work such
support into all of the other spacecraft management activities on their plate).

Furthermore, since SUNSAT is not beaconing during this time, for now you
will only hear data if other users are uplinking, which in turn will cause
SUNSAT to downlink.

>anyone know what I could do to accurately predict the sat passes (and works
in Linux?)?

The following link works well enough for me to know when to expect a pass
and about where it will be in the sky relative to me. It is not as fancy as
the programs providing AOS/LOS Az/El data, but anyone with a browser can use
this web page.

http://www.heavens-above.com/orbitdisplay.asp?lat=39.112817&lng=-76.860217&s
atid=25636

This link is actually a "stripped down" version of the link I normally use.
If you start at http://www.heavens-above.com/detailform.asp and fill in the
prompts, your local data will be stored for use by the web site. It just
happens that not all of that data is always required to generate the final
result.

Finally, another nice feature of this site is that the two-line orbital
elements are posted at the bottom of the page, and seem to be kept up to
date, making this web site a good source for TLEs.

Bob covered the procedure for how to select an alternate path for sending
local messages for the DOS APRS program. I will try give you the procedure
for how to select an alternate path for the WinAPRS program.

Under the Settings pull down menu, select Alternate VHF path. Then if you
select Other, a window will pop up that allows you to specify the alternate
path to use while you are exchanging messages with a local station that does
not require the normal path which will cover a large area.

Once you are done conversing with that station, go back to Settings,
Alternate VHF path and select Default. That will restore your normal path
setting.

You noticed that underneath where you selected Other or Default, there was
also a list of alternate paths, you could select one of those if it
appropriate for your area or you can do what I have done, is customize that
list to what I might want to use for alternate paths. You can customize
this list by going into Explorer (your file manager) and go to the folder
that contains your WINAPRS.EXE program. There you will also find an
altpath.txt file, double click that file and edit the entries to suit your
fancy, then save the file. The next time you start your WinAPRS program,

you will see your personal alternate paths in the Alternate VHF path listing
and you can select the path you desire.

Hope this explanation clears up the question of how to select a shorter
Alternate Path while corresponding messages with a nearby station in
WinAPRS.

OK, understood. But what are the selections under New Message Dialog?:

Default path and Reverse path are obvious, but Other ONE, TWO. Are/Is this
working? ONE, TWO are they hops or alternate paths as path one or path two?

VIA UOSAT5.

ALthough I digi via UO22 regularly during my morning commute, I was
completely unsuccessful over Field Day. First I was using the D7, then I
went to he D700 with an Arrow. Still not a single packet. Im sure the
reason was the fact that there were 17 PACSAT stations logged on (comapred
to 1 to 4 usually) so the uplink channel was saturated.

Thank goodness for SUNSAT who gave me the needed QSO with N8DEU!

This is not a function I have played with. Not sure exactly what it is
supposed to do or if it is working yet or not.

Can anyone shed any light on this choice? Perhaps one of the Sproul's will
have to field this question.

406. [htaprs] D7A(g) Postion won't change (1-3)

From: "hasan schiers" <schiers@netins.net>
Date: Mon, 26 Jun 2000 12:02:54 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-93078-2000.06.26-12.07.25--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

My D7A(g) has 3 positions that one can program into it. I put in 3 different positions which reflect home, work1 and work2. When I hit the position button and use the cursor keypad to select anything but the #1 position, it still sends only position #1...(home).

I must be doing something incredibly dumb...but I can't transmit the data from positions 2 or 3, no matter what I do. If I change the values in pos 1 and send a position, it changes just fine.

What do I have to do to get my D7A(g) to actually USE (transmit) the values I have put in POS2 and POS3 ?

Tnx...

Rendered body type: text/plain

Nothing dumb, Kenwood just makes us press one more button to enable the position. Scroll to the position that you wish to enable, then press the "*" (MHz) button. You should then see a "*" in front of the position selected.

Walter

409. [htaprs] D7A(g) Icons and WinAPRS 2.4.7?

From: "hasan schiers" <schiers@netins.net>
Date: Mon, 26 Jun 2000 13:34:50 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-93114-2000.06.26-13.57.44--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This LIST is entirely too cool! Now that Walter has solved my position changing problem. I only have ONE (ha!) remaining quirk that I haven't made progress with: Displaying the icons from the D7A(g) on my home station WinAPRS ver 2.4.7.

Does someone have a list of icons available on the D7A(g) that will display properly in WinAPRS 2.4.7? Most of the ones I would "logically" select on the D7 only show up as a red dot in WinAPRS (not very interesting or informative).

I'm not talking about the 'OTHER' ones you program yourself by selecting a punctuation mark and then a "Table" value for, but rather the "predefined" icons in the D7. I have tried the following with the result in WinAPRS of a "red dot" and nothing else:

The Tent
The Runner
Several others that I can't recall.

The Kenwood "W" Icon generates a yellow "DF" on WinAPRS.

If someone could make a recommendation for what Icon to select from the predefined list in the D7 that would show up in WinAPRS , I would really appreciate it. Keep in mind, it will never be used from the car, as a mobile. When I'm using the D7 it is with me walking around somewhere.

If none of the predefined icons work with WinAPRS, perhaps someone could suggest how to construct an "OTHER" from the D7a menu. This, as best as I can understand it, requires TWO values, one a 'symbol' and the other a 'table'. It looks like the table is either / (slash) or \ (backslash). So, if you have a suggestion that works for you, please include both the symbol and table values for me.

I would think the Kenwood W, the Tent and the Runner all would be reasonable for the D7 in "walking" service, but I'm open to anything that isn't downright silly, like the Thunderstorm icon.

I'm getting pretty good at programming the D7a and ag from scratch. I went to visit the Boone County, Iowa field day group and their fearless leader kb0hyy had a D7a sitting there and told me he had had his for over a year and never could figure out how to get it running on APRS. It took me about 5 minutes to get him all fixed up. The menu structure is very intuitive, once you realize that 'OK' means enter the area you want to modify as well as accept the value I just set. (That one stumped me for about an hour the first time I used my D700.) So...it's an 'OK' to move into the area you want to modify, then set the parameter, then another 'OK' to actually set it. Not all that obvious to my way of thinking but once you see that's how it works, it is very easy and fast to set up a radio from scratch.

I even did mine a second time because I got desparate when I couldn't get my 2nd and 3rd positions to work. (Of course, Walt fixed me up on that one, but not until I started from scratch).

BTW: That 17" long, skinny dual band Comet sma antenna works REALLY WELL on the D7. The duckie that Kenwood provides is every bit as bad as the ducky that Icom provided with my old IC-32. I've seen several people recommend the Comet mentioned above, and I completely agree with them. It seems rugged, but presents very little load to the D7a's sma connector and works MUCH better than the standard duck.

Hi Hasan

Its on page 9 of the manual, as a sub paragraph to item #3.

I must admit, its not very obvious!! I had to search for it myself when I
got mine back.

I don't know about the rest of you, but I am receiving increasing amounts of SPAM from the aol.com domain. I realize that the people sending it are probably not actually using AOL, but all I can do is send a note to abuse@aol.com and block all messages from that domain. Until they fix their problem, anyone addressing an email to me directly from aol.com may not get viewed.

This is not to say that I won't screen the messages nor is it to say that I get an incredible amount of email from individuals it's just that "Delete" is almost gone from my delete key. :-)

412. [htaprs] New D700 Programming Software V 1.00

From: "Larry Zanella" <larry.zanella@attws.com>
Date: Mon, 26 Jun 2000 21:43:21
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-93219-2000.06.26-21.47.11--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

So far, the only difference that I have been able to find between Kenwood's D700 Beta programming software V 0.00 and the latest D700 software V 1.00 released today (June 26) is that they changed the graphics in the shortcut icon. I must admit that the new shortcut icon is way cool compared to the original one (and the original one was fine), but this seems like a small change to warrant a new release.

Has anyone found any discernable differences in the two versions?

Larry

I believe that this could be a problem with UO22.

>From distant memories I recall that the downlink on UO22 has a few small
problems in relation to bandwidth which can cause a low through-put. I can
not remember the exact details but I do remember that there was a mod that
could be done on the RX equipment of a PacSat ground station which would fix
the problem and increase the downlink through-put. This may be related.

Cheers

415. [htaprs] D7 and WinAPRS Icons

From: "hasan schiers" <schiers@netins.net>
Date: Tue, 27 Jun 2000 06:15:16 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: <aprssig@tapr.org>
Message-ID: <LYR845-93299-2000.06.27-06.18.42--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm running WinAPRS 2.4.7 on a Win98SE machine. When my D7A(g) sends a
position, WinAPRS shows nothing but a red dot for an icon for the vast
majority of Icons that I can select with the D7. In fact, for the
pre-defined icons in the d7, only one produces something other than a red
dot in WinAPRS, that being the Kenwood "W"...which shows up as a yellow DF
icon in WinAPRS.

Does anyone have a hint how to get a reasonable icon for a walking around D7
(I'm not using it in a car or fixed location). Please be very specific about
how to set the D7. If I'm not using a pre-defined icon, I think it takes two
values in the D7's "other" icon setting, a field and table value.

I'm assuming it's something in the way the D7a puts out its icons, because
the D700 shows up as a car just fine.

tnx in advance, 73

I'm in the market for a PDA.

While I'd really like a Psion 5 (can't afford one!), I'm wondering what real
differences there are between the equivalently priced PalmPilots and Handspring
Visors (~$250). I've heard that the Visor's don't have upgradeable OSs as the
PAlms do. But hte Visors have that nifty slot for accessories...

Any thoughts, comments et al are appreciated!

I've read the manual over and over and believe everything is set ok but
when I hit the beacon in manual APRS mode I do not send out APRS. Viewing
it on 144.390 on packet I see that most stations start with APRS or BEACON
but mine has my call and instead of APRS it has T2UX09 and where the pos
data is supposed to be at I just have 5 or 6 garbled characters. My
position is set properly. Called Kenwood and they said they weren't
knowledgeable and to put out the question here on the SIG. If someone could
give me a set of values/settings that work for them I will probably be ok.
Don't think its the radio.   Thanks, Mike WA8EBM

Mike,
  A raw MicE packet looks like this :
N5LTC-9>S1RWRY,N5LTC-3*,WIDE5-4,GATE:'l8>l Uk/]":G}
Originating call>MicE information,Via,Via,Via:Remainder of MicE information.

The decoded MicE information :
3127.29N 10028.34W 057/000/In service
Latitude, Longitude, heading, speed, status.

IGATES may convert the raw packet and pass the conversion on the Internet feed
:
N5LTC-9>APK002,N5LTC-3*,WIDE5-4,GATE:@270657z3127.28N/10028.33Wk057/000/Mic-
E/M2/In Service>l Uk/]":G}

I suspect that your MicE packet is not defective. If you supply the entire
packet as received, I will decode it and return the result to you.

Rendered body type: text/plain

It sounds like you are able to transmit (the little red light flashes as
your beacon tx's). The six character code should be MIC encoded packets (or
compressed data that is the equivalent to your position). Most others are
not mic-e packets. These should be decoded by winaprs or dosaprs, or any
other viable APRS program. If a digipeater is nearby, you should be able to
check that this is your actual position with any of the above software.
Sounds like everything is OK to me though.

On a side note: I notice the G model does not transmit an auto beacon if you
do not have valid position from your GPS (while set to GPS NMEA). However,
it sounds like you have entered a position and have it set to GPS NONE, and
you apear to be transmitting, so I don't think this is the problem.

Hope this helps,

Walter

Walter

I just saw a post on the VHF reflector, and it made me think about my own problem. When wearing my polarized sunglasses in the car the display on the D700 is jet black. If I rotate the head, or my head I can get a usable image. I haven't found a good place for the head that is tilted that doesn't look wrong. Someone mentioned a "polarity reverser". I imagine it is some sort of polarized film. Has anyone tried it with the D700 head, or know where I could come up with some?

Mitch Bogart, KA1MIT, had a short piece in QST sometime last year about the same problem with an IC706. His solution, as I recall, was a film available from Edmund Scientific. The article (a hints 'n kinks thing) ran somewheres around mid-year, I think.

They run PalmOS, and are not DOS or Winows compatible. But there is all
sorts of software for them. In fact I saw a software package for the
PalmPilots that would would do stats for baseball leagues, just like the
book you see people writing in during little league games. For our use they
have terminal emulators, PalmAPRS, etc.

They do have a serial port. The PalmPilot is RS-232, but the Visor has
different voltages, so you must buy their cable, I am not sure but they may
be TTL voltage levels.

Hope this helps.

Scott

The one difference that convinced me to by a Palm Pilot is that the Palm PDA's
have their OS stored in flash ram, which means they are software upgradeable.
Handspring Visors are not.

 You are transmitting! That you see your packets is indication of
that. The format you see is Mic-E compressed encoded position data. it
uses the TO field and several bytes of the data field. The questions
that need answering ... Where are you? Is there an APRS digi nearby
enough to hear you? What path did you set? If you don't set a digipath
all you will do is broadcast to those in direct hearing range.

I'm sorry to keep bugging the sig, but I STILL can't get any icons from my
D7A(g) to display on a WinAPRS 2.4.7 machine.

Is there anyone out there running 2.4.7 AND using a D7A(g) that is getting a
"meaningful" icon which identifies the D7 on a WinAPRS 2.4.7 screen.?

Someone suggested rebooting WinAPRS...I did that and also rebooted the
entire machine...no change. Nearly every selection of icons in the D7A(g)
results in nothing but a "red dot" icon in WinAPRS 2.4.7.

Not that it's critically important...but ya know how something that doesn't
work as you expect "gnaws" at you? Well...I'm starting to feel pretty chewed
up over a silly situation.

If it's simply a matter of a bug in the way winaprs 2.4.7 handles icons from
the D7...fine. I can live with it until it gets fixed. The icons generated
by my D700 show up just fine.

I would just like to understand what is going on. I guess when I have time
I'll transmit the same icon from my d700 in the car and the d7a in the shack
and see how they look different in the transmit string. There has got to be
some explanation. 73

>Mitch Bogart, KA1MIT, had a short piece in QST sometime last year about the
>same problem with an IC706. His solution, as I recall, was a film available
>from Edmund Scientific. The article (a hints 'n kinks thing) ran somewheres
>around mid-year, I think.

The product in question is a 1/2-wave retarder film. It rotates the plane of
linear polarization by 90 degrees, and it also changes right circular
polarization to left (and vice versa). Edmund part # is K53-206 2" x 2" 1/2
wave retarder for 560 nm, 2 pcs for $15.00. 800-363-1992. You may have to
rotate the film to find an optimal angle.

A related product for experimental fun is a 1/4 wave retarder (linear to
circular or vice versa) K35-205 2" x 2" 2 pcs for $15.00. One of these in
combination with a linear polarizer are what CRT anti-glare filters are made
from.

The material has a fast axis and a slow axis, both in the plane of the sheet.
Light polarized in the slow axis direction will be retarded by the nominal
number of wavelengths as compared to the light polarized 90 degrees away,
just a simple phase shift. This is often induced by residual stresses in the
material, also seen in most plastic sheets that are mass produced in roll
form.

So the first thing to try is any thin clear plastic sheet you may have on
hand. Many of these plastics exhibit the property you need even thought they
wouldn't be as optically clear as the product from Edmund. Remember
"cellophane tape"? The stuff that got pushed out of the market by "Magic
Transparent Tape?" That stuff was great in this application. And it was more
transparent than the stuff that was named "Transparent". After the
revolution, the Marketers are next to go up against the wall, just after the
Lawyers. <bg>

Rendered body type: text/plain

My biggest reasons for buying a Palm Pilot device are:

1) A true RS232 serial port. I carry enough adapters around that I don't
want to carry any more.
2) The Palm Pilot is the true pilot. It's the original so you know that all
applications will work on a Palm Pilot, but some may not work on the Visor.
For example, I noticed the other day that a new Hotsynch application on the
Palm web site specifically said not to use with the HandSpring.

Good luck,

Daniel

Hi,

I just piked up a tm-d700e at the hamradio/bodensee-treffe in germany
I already did the rx-mod (removing the green wire) and the repeater mod
(remove the resistor marked rept) so that it can do almost every thing the

tm-d700a can do.

I like to lay my hands on a remote control program for the tm-d700 like
the one for the th-d7.

anyone know if it exists?

Rendered body type: text/plain

YOu bet Roy...I have it checked. I do get proper display of the D7a(g) icons
on my D700...perfect. On WinAPRS 2.4.7, I get red dots for nearly everything
I select, except the Kenwood W, for which I get a yellow triangle with DF in
the middle.

I'm coming to the conclusion that there is a bug in WinAPRS 2.4.7 in the
manner it processes icons from the D7a(g)

If someone has a better theory, please advance it!

> Do any of these "palm" devices run DOS programs and have an RS-232 port.?
> Jeff

The Palms don't, but windows CE v3 is gaining ground and becoming half usable
now, and apparently there is a freeware DOS for it - I havent seen it running.

There is a LOT of software for the palm tho - most of what you think up, you
can do.   v2 of windows ce will even play DOOM (but v3 will not, yet...)

On this same note, I saw an NEC MobilePro400 palm computer running CE
1.0 w/4 megs RAM with the docking station, etc.... for real cheap....
Can anyone recommend any uses of this equipment? The serial port used
to connect to a desktop computer (for syncronization) would probably
require a null modem adapter to be useful for packet....does that sound
right?

>I fantasize about new APRS routing modes, such as
>"route to lat/lon" or "route to gridsquare" where a digi that receives a
>packet thus encoded will digipeat it if and only if it is closer to the
>destination lat/lon than the digi that sent the packet.

This is something that I plan on trying out in my APRS investigations in Java this summer. My variation was to have the Digis rewrite the path based on other digis they can hear that are in the direction the packet needs to go. I don't have a thought yet on how to automate the use of IGATEs to do long haul transmissions, but I suspect that a simple rule might be that if the total distance exceeds a setting, that you would GATE instead of going out RF again.

IP routing (as in TCP/IP) uses a more general approach of a single default route and explicit routes. This reduces the number of explicit routes so that you can utilize the big pipes or most reliable transports for traffic that you don't really want to know about explicitly.

I think one of the concepts that APRS misses out on is that it guesses routing based on what users tell it instead of instituting routing based on what it knows. This is the problem that UUCP has without routing tables. When you add routing tables to UUCP, then the problem is not so dramatic, but there is still too much explicit information that makes it impossible to use working paths that would suffice when something is broken.

APRS could use default routes for each direction and provide a list of DIGIs to cover general direction coverage. I know it already provides this in the PATH, but the user must specify it, instead of having the DIGI institute it when it makes sense.

The ICMP (Internet Control Message Protocol) adds to the power by letting routers notify other routers when particular paths are no longer available. This allows the network to heal itself as best it can. I think that the next step is to contemplate these things and start to experiment with ways to reduce the explicit routing in packets (reduces bandwidth use) and move towards a more automated system that truely empowers the community to communicate effectively and reliably without so much explicit knowledge of the state of affairs from moment to moment.

Clearly, DX CW and Voice work allows us to take note of stations and associated call signs in specific areas. When we need to make contact into that area, we are well armed to make that contact effectively.

APRS I believe represents a completely different side of communications. Much like the government decided with the arpanet (now the internet), there are communications that sometimes must go through, no matter what routing is available. APRS, because of the nature of mobile users, and the expectation for it to work, must be able to take advantage of any available path with a limited amount of effort on the senders part.

We really should be able to just dial EMERGENCY! on the th-d7, turn on beacon, and not have to do anything else for the first level of notification. Without this, we will all have to know whether to use RELAY, WIDE or WIDEn-N first based on what the local TNCs have been configured with. I fear this will never be predictable with the current TNCs.

Until we can take this first step, I fear that many will still consider APRS a toy that if you have time to mess with, might be fun, but generally is too undependable to be useful.

APRS was clearly designed with a lot of foresight into the state of affairs of, then current, packet radio implementations. And the next step must clearly allow a miagration that does not interfere with existing systems. But, we have to be able to agree to make a change, and be willing to try out some ideas first.

Rendered body type: text/plain

Hi Hasan,
I am new to aprs and the programs -just got my D7 last week. I also get the red dot and the DF when I use the D7. I have so far discovered that when I use the new Winaprs version and use my PK232 I get the dot and DF but--- when I use my old Heath HK-21 handi-packet I view the icons just the way they are supposed to be with Winaprs. So it has to be a TNC problem and not the radio--- If I figure out what parameters need changing I will let you know.

Rendered body type: text/plain

Hi All

I see that this topic has come up again. I was in this sticky situation not so long ago myself. He is my out look on the situation to help those who can not decide on what is best.

Just to let you know I have a Jornada HP 420 WinCe device. A wounder full little device. I run APRS CE on the unit using the travel cable (Witch dubbels up as a charging travel cable) and the same config that the GPS cable for my GPS 3 uses in the PC jack on the rig. Works very well.

The reason that I went for a CE unit is I can run packet on the unit as well. Ok it is a bit primitive as it uses the network dial up adaptor terminal window. To my knowledge the Palm units do not have a terminal emulator, well not that I could find on the web.

On the down side for the CE units there is not quite the chose of apps that the Palm units have on the web but that is slowly changing.

I have played with the Palm 3 unit and I still think the CE unit wins hands down but that is only due to the other salt mine activities that the CE unit is better suited for in my case.

The best word of advise is look at the unit from an angel of use other than that of APRS. In my case it was APRS, Packet and work related and the option of playing MP3's :-)

Hope this helps point you in the right direction.

One thing that we can take advantage of is "not every digi needs to be a smart
digi". The "classic" digi's can be used as transport, while the smart digi's can
be used as routers.

All the smart digis have to know is, what path of "classic" digi's will get me to
the next "smart" digi. They could then explicity route to that digi. The smart
digi's would look for a routing label ANYWHERE in the path, not just in order.

For instance: a path of "RELAY,WIDE,NET" could be digi'd by any local relay and
wide with the hopes that the "first mile" hops get it to a smart digi.

The smart digi, when it sees a NET anywhere in the path, knows to completely
re-address the packet with a direct path to the nearest I-GATE...

Similarly, a smart-digi that hears a packet with a path containing "DM78NV" could
lookup all the digi's it has heard the posits of, and construct a path to that
gridsquare. The digi's in between are simply network -- the smart-digi's are the
network intelligence.

> the next "smart" digi. They could then explicity route to that digi. The smart
> digi's would look for a routing label ANYWHERE in the path, not just in order.
>

Forgot to mention: a special identifier on the smart-digi's posit could
be used to alert every other smart-digi in the network to the fact that
it is a smart digi. This would allow "arp" like route discovery. In
this way, mobile smart digi's are possible.

447. [htaprs] UO-22 on a TH-D7A (G)

From: "Don DeJarnette" <ddej@gsa.state.al.us>
Date: Thu, 29 Jun 2000 12:44:11 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-93891-2000.06.29-12.48.46--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been experimenting with APRS on UO-22 with a TH-D7A (G) and a whip antenna (Premier AL-800 and Comet SMA-24).

I have yet to see "My Position" or "My Message" on the downlink. Joel (K2SAT) saw me logged in with his TH-D7 and Arrow. He has had some success with this arrangement. It seems that every time I beacon, the satellite returns UOSAT5-12, but no "My Position". I do have position info entered correctly and "My Position" appears on the local digi at 1200 baud. Does the fact I receive the UOSAT5-12 when I beacon indicate the bird is busy or a incomplete exchange ? I understand that I must have a full duplex exchange to get the received "My Position".

Both Joel and I have experienced an anomaly when receiving UO-22 on the TH-D7A (G). When the satellite is at it's strongest (1-4 bars on the S-Meter), the TH-D7 (G) refuses to manually beacon. We have found that if you turn the HT off and on then it beacons correctly. Is this anomaly a problem with the HT or UO-22 ?

The parameters I have set up on the TH-D7 (G) that are unique to UO-22 are:

1-4-2   Ignore DCD
2-B   UOSAT5
2-M   A:TX B:RX
2-N   9600 baud
I have GPS turned off.

Please clue me in on any errors or omissions.

I would appreciate anyone who has seen my call sign (KC4YRT-3) on UO-22 to E-Mail me. It is not my intention to QRM the bird.

Don,

I have yet to see "My Position" or "My Message" on the downlink. Joel (K2SAT) saw me logged in with his TH-D7 and Arrow. He has had some success with this arrangement. It seems that every time I beacon, the satellite returns UOSAT5-12, but no "My Position". I do have position info entered correctly and "My Position" appears on the local digi at 1200 baud. Does the fact I receive the UOSAT5-12 when I beacon indicate the bird is busy or a incomplete exchange ? I understand that I must have a full duplex exchange to get the received "My Position".

UO-22 is working fine. You will see UOSAT5-12 being used as part of the PACSAT Broadcast Protocol that is employed on UO-22. Remember, the main function of UO-22 is a PACSAT Broadcast satellite that transmits a continuous stream of data at 9600 baud. This is very much unlike a regular terrestrial ground station where packet data is sent in short bursts of data. I will give my TH-D7A a try this evening
and log the data on my satellite station as I watch for MIR and ISS to visibly fly over Huntsville and the
Southeast USA tonight.

Both Joel and I have experienced an anomaly when receiving UO-22 on the TH-D7A (G). When the satellite is at it's strongest (1-4 bars on the S-Meter), the TH-D7 (G) refuses to manually beacon. We have found that if you turn the HT off and on then it beacons correctly. Is this anomaly a problem with the HT or UO-22 ?

The problem is NOT with UO-22. It works great. We used it on Field Day for APRS, but only found one person for a keyboard QSO. The anomaly is with the TH-D7A.

The parameters I have set up on the TH-D7 (G) that are unique to UO-22 are:

```
1-4-2    Ignore DCD
2-B       UOSAT5
2-M       A:TX  B:RX
2-N       9600 baud
```

I have GPS turned off.

Your parameters look fine for digipeating through UO-22 as it will recognize UOSAT5.
I will listen and IGate posits on the 00:37 UTC pass this evening for UO-22 and you can check to see if you have been heard on http://map.aprs.net/"your_callsign". Just substitute the callsign-SSID you used for your_callsign and if you are heard, it should appear at this web site. If not, I will save my log file.

Typically, yes. Have a look at my UIVIEW page (its rather messy and wordy
but I have a bit about null modem adaptors on it)

http://you.genie.co.uk/carl.littlejohns/aprs.htm

v1 CE is quite primitive, but Im sure you could get a terminal program for
it for controlling a TNC (or running a capture file) at the very least.

454. [htaprs] TH-D7A acting strange

From: "Tim Cunningham" <tim_cunningham@mindspring.com>
Date: Fri, 30 Jun 2000 08:33:36 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-94120-2000.06.30-08.38.56--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

My TH-D7A version G seems to be acting strange. Yesterday, I noticed
that the Automatic Power Off was activated, but did not turn off the radio.
When I tried to turn it off and back on, I observed the following:

1. The A LED is lit and the unit is locked in transmit
2. The TNC, STA, and CON flags are all active.
3. The message "OPENING TNC" stays on the screen

If I turn the unit of and on a few times I can get it out of the TNC mode
eventually, but I think it needs to go back to the factory. It will not
enter the APRS TNC mode properly as the "OPENING TNC" remains
on the display on each attempt. Then, it is back to turning the unit on
and off a few times to get it out of the TNC mode and back to non-

APRS use.

I tried doing a full RESET a couple times with no luck.

Right after the version G upgrade I did notice that my LIST function
was getting some erroneous data as well as multiple duplicates
for several stations. When I RESET the unit at that time, it appeared
everything went back to normal.

Anybody else had any similar problems and could you correct it
without sending it back to Kenwood. The box is ready if I cannot
get this going today. No more satellites with the D7A until it gets
resolved ;-(

I wrote to this list about a month ago regard flaky behavior of my TH-D7A. It
did this kind of thing. I could usually correct this by powering it from the
car 12volt adapter, or my dry cell pack. But, it may be that I just removed
power 2-3 times and it finally fixed itself as you have experienced. There
were many other weird problems with it that culminated in it locking up, and
then refusing to get past "Resetting, please wait!" no matter how I powered
it. Since I had bought it in May, I sent it back under warrenty. I talked
with a Kenwood technician after they had notified me that it was comming back
to me.

He said that they reset it, plugged it into the test set and configured it for
APRS. He saw it doing things that he did not even want to start to analyze,
so they sent me a replacement which I got yesterday (total time 2 weeks). I
have not had time to use it much, but it acted a bit odd when I first powered
it up.

I will continue to evaluate whether the new radio has corrected my experienced
problems.

If you are having any weird problems with lock ups, I would strongly suggest
that you contact Kenwood about returning the radio for replacement. There may
be a batch of incompatible parts (timing or otherwise) that are causing these
problems! If we can help Kenwood understand the number of radios that do have
problems, perhaps fewer will have to experience this nightmare!

Has anyone had any luck mating the RM $60.00 GPS with the D7? When I initially mated mine it worked fb the first time but has not been able to communicate since. After looking at N6QAB's GPS compatibility site for the older D7's I can see that the output data that I read from my RM was not compatible with the older D7's (has 4 digits in the $GPGGA string where the useable ones have 3). I am not sure if the upgrade to the G model eliminated this problem. Can't understand why it worked once and never again.

Mine is an out of the box G.

It works fine. Do you have the xmit on auto.

Buried somewhere in the aprs menu.

If I remember the options are no/manual/ptt/auto

I have sent numerous messages directly from the D7aG

Mike,

It may not just be your connections.

There are three of these RM GPS's here in the central MO area and I've found
that at times they simply stop receiving satellite information. One of the
hams had problems in the house, took the thing outside with a laptop with a
clear path in all directions and still couldn't get a lock. He thought it
was dead. A few days later, he gave it a second try and amazingly it came
back to life. Mine typically goes dead at around 9pm CDST each night (this
could be because it's in the window sill and the satellites move to the
other side of the house though. I'll be checking this soon as I get my Tiny

Trak in a box and go mobile. Seems like it should find SOME satellites
though past 9pm).

Just in case there is a bad batch of these GPS's out now, the serial # is
9-6-A-59-2347. Model # 1225B-R1

Any others on the list have similar problems with RM?

73, KI0MI

465. [htaprs] Kenwood TH-D7A(G) Observations

From: "Eric A. Cottrell" <eac@shore.net>
Date: Fri, 30 Jun 2000 19:26:13 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-94221-2000.06.30-19.30.08--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

I got my radio back from Kenwood Thursday after a two day trek up the coast.
They replaced a few parts, checked it out, and upgraded it. UPS sent a email
with a tracking number to the email address I supplied.

I have not tried it out on alot of stuff (like satellite) but it seems to work
very good and I like the new features. I like the added GPS stuff even if you
have to use a key to toggle back and forth. The displays seem more useful.

It appears the D7AG beta program is the D7A program with protocol changes
to get it to talk to a D7AG. I assume they will add the new parameters.
It was handy to get my settings back (I had to remember to update the string
from APK001 to APK002). At least I could get my memories back in.

I also apreciate being able to do 1750 tone burst. I did not feel like
dragging along the D700A (it can do it as well) on the plane. I managed
to tone burst my ICOM IC-24AT (got stolen) by adding a few parts but the
old ICOM W2AT was more involved so I did not do it. I would not be surprised
if my 24AT tone burst mod is stuck in some archive somewhere. I would not
be surprised if I could get most of the UK 2m/70cm repeaters programmed in
to the radio with the 200 memories 8->.

I am going to try some satellites this weekend. Later next week I may be
up in the Oak Bay area of New Brunswick and may try some stuff up there.
I am going to run my APRS and see what this Maine network is all about.

One handy feature about the control programs is I can sync both radios to
the same frequencies easier. Too bad there is no import function where
you could read memories into both programs. I reserve the higher memories
to repeaters I use while traveling. The alphanumeric display is great for
telling where the repeater is. I coded it so local stuff uses all 8
characters like Marlboro and out-of-state stuff uses 6 characters with
the last 2 for the state like FairboOH would be the Fairborn, Ohio
repeater. It would be nice to set up a file with Dayton frequencies, or Maine
frequencies and you could read that file in without the blank entries clearing
the existing entries. So I could have only Dayton frequencies from 160 to 180
in the file and when read it only set memories 160 to 180 and leave the local
stuff at 0 to 30 alone.

The APRS and packet frequencies are in the 190 to 199 locations mainly to
get them out of the way. It is handy as I can easily access them by going
"below" channel 1. I also have all 7 weather service channels programmed
in. It was interesting to listen to the different stations I could receive
on the way to Dayton and I find it very useful.

Rendered body type: text/plain

Had a problem with th7 not recognizing gps input. I got the guts and disassembled my 10 day old radio. As I thought, it was in the GPS input jack. There was a broken what appears to be resistor that goes from the ground sleeve on the connector to ground on the circuit board. The shield was completely disconnected from the radio. Does anyone have a schematic and could tell me what the value of the resistor is supposed to be. I guess it is about .5 ohm. The one that was in there was completely bent up and broken-strange how it passed their QC tests.   Mike WA8EBM

Message-ID: <LYR845-94300-2000.07.01-05.33.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello All,
Any UK Hams out there using either PocketAPRS or APRSce if so where did you get the maps from or is there anyone that has made their own? (How ?)
Any pro's & con's ref Palm IIIx vs. CE devices ? I use a Psion 3c 2mb at the moment and have all but given up on it, the cost of progress I suppose :(
Any info at all would be most welcome !

73 de Steve G7EXZ (TH-D7E Mk2)

PS.
Bob, Have Kenwood started work on the D7's future replacement ? yes I think it's a GREAT Rig but I'd like to be able to trickle charge & use it at the same time, the only other improvement I would like to see is a "feature connector" on the bottom (ala mobile phones) to combine Antenna/Power/Data/GPS/Ext.Speaker this would enable us to "roll our own" accessories for Mobile or Base use (remember that cool Mobile Pwr/Charger for the Yaesu FT51r ?) AND connect to an external antenna without messing around with SMA connectors - yuck
Any suggestions from other users perhaps we could pass on our "wish list" to Kenwood !

If you are talking about the MCP program, You can get it off Kenwoods FTP
server (ftp.kenwood.net) you need to go down the software directory instead
of the amateur directory. It seems to work ok. On the plus side outside of
a few minor things, you can use it to read in the D7 config and use it as a
basis for D700 config. It made it much easier put the repeater freq into
it, since I didn't have to retype them in.

Rendered body type: text/plain

Check out the new D-700S model on Kenwood's Japan sight---it has built in
GPS! Now I know why I couldn't figure out what that extra Molex connector
was for (the one in addition to the voice synthesizer module plug). As best
I can read Japanese, the optional GPS plug in module lists for
$140---smells like a street price of $100--not bad!

Well after looking at the sight, Congrats on figuring it out.

The only thing I could figure was the optional TGP-10 which using the
currency calculator I used works out to $366. US! Hope that's not right.

Rendered body type: text/plain

Has anyone made a GPS passive repeater to bring GPS signals into a
building? Our aluminum shingles keep GPS out of the garage. I'd like to
put an antenna on the roof cabled to a radiator inside, to keep the GPSes
locked on while the cars are in the garage.

Oh, and I'm looking for recommendations for a no-display GPS engine that
will run on 12 vdc, accept an external antenna and squirt out NMEA
sentences suitable for the D700. I want to stick a D700 in my wife's new
4Runner, and use a combo hockey puck cell/GPS antenna on the roof for
those 2 functions. (She's already missing her TM-733 and cell phone, and
she's gonna let me drill the roof for the 2 antennas we need. Oh boy!)

Keep in mind that just because it is available in Japan by no means implies
that it will also be available in the US! Also, who knows if the 700S
requires an entirely new radio (GPS antenna port,etc.). I wouldn't change
my buying plans based on their Japanese version. Sure is interseting,
though!

The Garmin GPS 35 PC is great! The Garmin supplied DB-9 terminated cable
plugs into the Kenwood PG-4W cable for true plug and play connection to the
D700 via the PG-4W cable's 2.5mm stereo plug termination.

If you go the other route, check with Radiall/Larsen as they have an
integrated cellular/GPS antenna all in one. However, don't forget that this
will not work with a dual band phone (850 MHz cellular and 1900 MHz PCS).

>Has anyone made a GPS passive repeater to bring GPS signals into a
>building? Our aluminum shingles keep GPS out of the garage.

I have seen such used in an office/lab setting, and at a trade show in a
hotel conference room setting.

An antenna was simply put on the roof, cabled to an amplifier with about
100' of coax, and retransmitted inside through a pattive antenna.

I have heard that a direct antenna to antenna connection with an extremely
short run (ie: inches) _may_ work, esp with an amplified antenna on the
outside and a passive antenna on the inside.

I have not set up such a thing though, so I can't be real specific.

>Oh, and I'm looking for recommendations for a no-display GPS engine that
>will run on 12 vdc, accept an external antenna and squirt out NMEA
>sentences suitable for the D700.

I like the GPS 35 as well. The GPS engine and antenna are all in a unit
about the size of a small mouse case. I ordered the GPS35-HVS model
(010-00153-03) which as RS232 level outputs and runs on a wide range of
power. Online manuals are available at the Garmin site. Depending on how
you want to attach it to the roof, you can simply run screws through the
roof into the unit, or buy something like the magnetic mount accessory.

Of course that will not help with the cell phone antenna.

>I want to stick a D700 in my wife's new
>4Runner, and use a combo hockey puck cell/GPS antenna on the roof for

Rendered body type: text/plain

Oh yea,

The manual is online at

    http://www.garmin.com/manuals/spec35.pdf

This unit can do alot of stuff that I don't need (like RTCM DGPS support,
unit status, and phased data output) but it's there if I ever want to try
using it.

Pages 8 through 13 show mounting options and the wiring diagram.

Don't be distracted with the Evaulation Kit stuff. Unless you are trying to
develop a system that requires actively interfacing with the unit, it's
unnecessary overkill.

Rendered body type: text/plain

Most of the non-display GPS's I have seen seem to cost more than the cheaper mass manufactured "with display" models. However, the best non display model I have seen is the pharos gps. It is about 2" x 2" and last I heard cost about $125. You will have to step down your cars 12 volt source to 5 volts, but that is easy.

http://www.pharosgps.com/product/igps180.pdf

Another interesting device is the Handspring Spring Board module from Geodiscovery. This GPS device plugs into a Handspring Palm PDA and provides mapping software as well as the integrated GPS device. It is supposed to retail for about $250 (thats the SpringBoard Geodiscovery GPS module only). Check out http://www.geodiscovery.com/GeoFlyerV2.pdf for more info on this not yet deliverable item, or www.handspring.com . My Handspring 8meg Palm is on its way from Handspring ($249) ..... I can't wait to use it with PocketAPRS :)

The docs refer to two serial ports on this device, but the wiring diagrams seem to indicate that it's only useful for hooking up a differential unit to the GPS 35. I don't suppose it can do NMEA on both....?

Here you go, cuz:

http://www.navtechgps.com/supply/rerad.asp

I wonder if you could just use an active antenna supplied with 5v to the amp
and put up a 1/4 wave re-radiator inside. I'll bet that would work.

>> Also, >my III+ has stopped sending NMEA data to my D7, or my D7 no longer >accepts NMEA data from my
 III+, take your pick. I see from the list >that I am not the only one suffering from this. Has any
explanation >for this been discovered as yet?

To answer my own question, I found the problem. The plug supploed by Kenwood has bad leads and should
not be used. My cable GPS Tx and Rx lines now both work since I replaced the plug. It was simple. I
bought a replacement gold plated soldertail plug from Radio Shack, cost less than two bucks.
This one opens up and allows you to solder the line leads to internal gold plated soldertails, then seal
 up the plug. The whole thing works great!
I only found out my posit was not going out from my D7 when I checked my Position using the POS button.
I would watch my position reading change as I was driving sometimes. A couple of weeks ago I noticed my
position was all zeros on the D7 POS display, but waypoint data continued to update on my GPS III+

screen as usual.
Many others may be in the same condition with the clunky plugs. I see at least four units regularly coming up on the digi network here in NJ as position JJ.OO.AA. Press that POS button folks and find out if you are beaconing zero posits.

Rendered body type: text/plain

In my opinion, I feel that the evaluation kit is well worth it.

You get all 4 mounting hardware units (complete with all hardware) which more than pays for the cost of the kit. In addition, you get the software that is necessary to program it. Any change(s) you may want to (eventually)make, such as selecting 9600 baud versus 4800, will require this software. And, since I wasn't sure which hardware mount I wanted to use, this alone paid for the kit, and now I have the programming kit.

My 2 cents...

Rendered body type: text/plain

Good evening,

I want to use my VC-H1 in a mobile setting without burning through AA batteries. Unfortunately, it runs on 6v and everything I can find will convert 12v to 5v, not 6v. Rather annoying.

Can anyone point me to a good source for a 12v to 6v converter to use with
the VC-H1? Failing that, a good circuit to build to do this? I'd prefer
something pre-built, due to my less than wonderful construction skills.

Thanks very much.

The Rand McNalley gps with StreetFinder 2000 works very well, and will take anywhere from 5 to 16 volts.
Not weather proof so it's only good for your personal car use on your dash or rear deck. You can
get them for $79 at your nearest RandMcNalley store or direct from them.

http://www.gpsnuts.com/myGPS/GPS/Hardware%20reviews/RandMcNally/rand_mcnally_gps.htm

It looks like my best bet is to either use one of my existing GPSes,
probably the Garmin GPS II+, or buy a cheapo new display model. It's
counter-intuitive to me that there isn't a no-display model with an
external antenna jack that's less expensive than a more capable one, but
that ignores market pressure. I'll just stick it in the cubby hole with
the D700, wire it into the battery, and forget that it has a display on
it.

I looked at Garmin 35s, but they don't accept external antennas, and
minimizing external penetrations is important in this case. I need 2m/440,
cell and GPS. I can do it with 2 holes with 2 combination antennas,
cell/GPS, and 2m/440.

Thanks to all for their advice. I appreciate it, and it confirms what I
was already concluding.

Chris,

If you're interested in making a small project out of it, I have the
perfect solution for you. You can do what I did in my D700 installation.
 I basically gutted a Rand McNally unit for the GPS engine, installed it
in a plastic case about the size of a pack of cigarettes, and put
appropriate connectors and switches for power, antenna, and data on the
box. Plug in the power, antenna and connect to the D700 and away you go.

If you're interested in the details, let me know.

Greg

If the GPS unit is inside the radio, it would either need an external antenna, or the chassis would need a clear, unobstructed view of the sky. I see no advantage to the configuration. There may be an advantage in putting a GPS sensor inside a D7, however.

Rich Carter - KE1EV

Check out the new D-700S model on Kenwood's Japan sight---it has built in GPS! Now I know why I couldn't figure out what that extra Molex connector was for (the one in addition to the voice synthesizer module plug). As best I can read Japanese, the optional GPS plug in module lists for $140---smells like a street price of $100--not bad!

There is less wiring and interfacing hassle. Also, if Kenwood has an integrated antenna, then it would be a snap! For instance, my Mercedes has a factory installed dual band cellular/PCS antenna (850 and 1900 MHz!) plus a GPS antenna, all 3 integrated into a single, multiband antenna system, with one coax run to the front panel 6" TFT display master conntrol system. The MCS includes a preamp, splitter and +5V bias supply 9for the GPS) all integrated.

I would think if Kenwood comes out with a GPS inside the radio chassis it would only be logical to come out with an antenna covering 2m/440 and GPS, all in one, with one coax run and one hole/mounting spot on the roof. Keep in mind that what Mercedes includes in my car is at least as complex as what I am talking about here. And, we all know that the Japanese are second to none when a technical challenge is laid down. In my opinion, it will depend on whether we are willing to pay some $bucks for this, or not.

I still don't see the advantage. You still need to connect an antenna! So whats the advantage of connecting an antenna vs connecting a GPS? For one thing you loose the ability to view all stations in a graphic display (the gps display), as well as the ability to view where the heck you are. The GPS gives me a heck of a lot of info on that little screen. Time, elevation, average speed, estimated destination time, distance from all waypoints, can also have alarms as you near waypoints/other stations, plus a ton of other features.

As far as the antennas are concerned, perhaps you would look less like a porcupine, but the gps antenna is fairly unobtrusive. And it sounds like two antennas (one for 2m/440 and one GPS) will be a heck of a lot cheaper than a preamp, splitter, and multiband antenna. However, if I owned a Mercedes I think I would be reluctant to drill a single hole in my roof, so it better come with a 2m/440/GPS/FM/AM/cell/PCS antenna.

Just my thoughts

Walter

I would think if Kenwood comes out with a GPS inside the radio chassis it

would only be logical to come out with an antenna covering 2m/440 and GPS,
all in one, with one coax run and one hole/mounting spot on the roof. Keep
in mind that what Mercedes includes in my car is at least as complex as
what I am talking about here. And, we all know that the Japanese are second
to none when a technical challenge is laid down. In my opinion, it will
depend on whether we are willing to pay some $bucks for this, or not.

That's potentially true except for one little complication - protecting the
GPS preamp from the 50W of 2M RF or the 35W of 440 RF. Excellent harmonic
suppression of the transmitters would also be a must, to keep from
overloading the front end of the GPS (now sharing the same coax) as 11th
harmonics of 2 meters are close if not within the pass band of the GPS.
This is one of the things some of us would like to solve for trackers
designed for SAR, to essentially be able to put the GPS antenna on top of
the 2M antenna, so both might be enclosed in PVC tubing and strapped to
searchers' pack frames. It will be interesting to see if someone rises to
the challenge.

Well, fortunately for you I have this Kenwood part number in my notes:
W01-0921-05. This is a cigarette lighter adapter for the Kenwood CD
players requiring 6vdc. This will fit and work for the VC-H1 units. The
Kenwood parts distributor should quote: $28.38 + shipping.

To all on the list,

Just to set the record straight and not let this rumor get out of
hand. Kenwood USA decided not to make the optional GPS available to the
general (US) market. There are so many full featured GPS units available
and is difficult to compete. Kenwood felt that most US operators would opt
for one of the available GPS units rather than to buy a Kenwood GPS. NO
New versions of the TM-D700A units will be introduced other than what is
available now.

Kenwood

I received a flyer the other from Antenex. Antenex has come out with an
integrated GPS/NMO mount. It has two coax runs coming from it. It allows
putting any NMO type antenna along with the GPS. I checked their webpage
(www.antenex.com), but I did not see it.

They also have an NMO GPS antenna if you already have an NMO that you want
to add the GPS.

Please could some one point me in the direction of an English site with info or pics of the D700S unit. All I can find is a Japanese site with no pics on the d700s unit. I did note that Japan has some strange models TM-V708 for one. Strange one that.

Many thanks

Peter

Without getting into the pros and cons of the marketing decision; I think it is GREAT that Kenwood is monitoring this list and is providing feedback! I wish some of the other manufacturers would follow suit (along with the Manual/Service bulletin FTP site, etc.) The others may lurk, but these are the only guys I've seen uncloak. FULL DISCLOSURE STATEMENT: All of my new gear has been of another manufacturer, with some used equipment from Kenwood, at least up until now as I'm getting more and more into APRS....

For about the same price I have installed a Pharos GPS to feed my D700. I have it mounted on the passenger side near the "A" post http://www.steffeninc.com/d71.jpg . The D700 is mounted on the floor with the display on the dash http://www.steffeninc.com/d72.jpg .

I was very impressed with the Pharos unit. It is about 1-1/2" square. The first time I plugged it in I had a position lock in less than 30 seconds. Don't know how it did that unless they pre-loaded the almanac during manufacturing.

My only complaint is that I am unable to read the D700 display in normal sunlight. If it is cloudy, dusk or dark it is great but a normal sunny day....forget it.

I have to admit that I am a bit disappointed with Kenwood on how they handled the upgrade to D7G. When I was at Dayton I was told by a Kenwood person in their booth that I should subscribe to the Kenwood e-mail system at their web page. I was told to do that to be able to get the information of the upgrade. The Kenwood sales guy told me not to send the unit in until the upgrade was announced via e-mail, not to believe what I was seeing on the APRS SIG about the upgrade since Kenwood would release the only official upgrade information.

Thank goodness I do subscribe to the APRSSIG! Kenwood has never sent any information (at least that I received and I did confirm that I am on the e-mail list). When I read on the SIG how people were sending their units in for upgrade I chuckled to myself that it would take weeks to get their unit back since the official release was never sent out. Imagine my surprise when people on the SIG starting talking about receiving their units back after only 1-2 day turn time! Well, I figured I should send mine in and get some of this great service, even though there still was no notification via e-mail that the upgrade was officially release.

Just so show you no good deal goes unpunished, Kenwood East Coast received my D7A for upgrade on June 21st. When I called today they had not started working on it yet but thought they might get to it today. Wonder what happened to that 2-3 day turnaround.

I had the pleasure of being at the right place at the right time this 4th July, as one of my friends' brother-in-law said "The next thing I need to look into, is APRS for my sailplane". This man had his own reasons for being interested in APRS as he was one of the "fathers" of the GPS satellites having been one of the senior members of the design team for the clocks that go inside them!

I was able to show him APRS in action using the Kenwood TH-D7A(G) and the TM-D700A, and now he's all fired up about setting up a tracker box in his 15m Standard Class sailplane. While he is electronically minded, I'm hoping that he'll invite me along to do the radio tests. Ok, Ok, I just want to go up in the sail plane! I admit it!

So, anyone out there go aeronautical mobile with an APRS tracker? What equipment do you use? How successful have you been? Did you discover any previously unforseen problems? Got any useful tips?

Julian, N3JF

Hi Julian,

I did about the same thing. A friend invited me up one
day in a Cessna 172 rented plane and I took the D7A and
a Tripmate.. What a blast! When I got home the track
was very cool and precisely laid out... I experienced
no lockups, had no difficulties beaconing at the 1
minute interval.. I forget what path I used, but around
the Chicagoland area I hope I used only WIDE, for at
1500 feet who needs RELAY hi...

Robbie

Rendered body type: text/plain

I have a couple of systems here exhibiting very odd behaviour.

ETE-3 is definitely working well. Except that ETE-5 can't connect to it.
ETE-3 also dosen't digi ETE-5's packets.
You'd think ETE-3 was deaf, except that it is digiing other packets just fine.

ETE-3 and ETE-5 both seem to intermittently respond to ETE-9's packets,
yet ETE-5 copies 9 just fine, even when 9's path does not include any digi.

What could be causing these systems to ignore each other?
I don't think it's an RF or audio problem.

(Way too many debugging projects on the fire at the moment.)

Has anyone looked at the circuit diagram?

It strikes me that running off 6v is non standard and that maybe the
designers were clever enough to have put a voltage regulator on the power
input of the VC-1.

Funny you should bring this up.....

I am actually in the process of installing a TH-D7A on my ultralight
aircraft (a powered parachute). The issue at the moment is weight and
space. To have both aircraft band and APRS/Ham, I will need two radios.

This just plain takes up more space than I would like. I already have a GPS
and an intercom system on a ram mount, so I have some of the system
completed. Once I get it all working, I will have to take a few pictures
and post them on my web site.

APRS would provide some GREAT advantages for me in flying. I plan on
mounting a weather station on a portable setup. Then wherever I fly, I can
get the wind direction and speed EXACTLY. Wind direction is extremely
important with PPCs for landing and take off. Of course I will still have a
traditional windsock as well.

I hope to get this all setup in a month or so. I am currently looking at
the two wire wx stations that are only $79. Seems perfect for the task. As
far as I know, this may be the first 'permanent' installation on this type
of aircraft...

I have been having problems with my new G firmware in the D7. If my GPS is
sync'd (I leave it connected to 12V in the car most of the time), and I
change the D7 GPS usage from "NOT USED" to "NMEA", before I plug in the GPS,
it will never display anything by zeros and blinking dots. If I power cycle
the radio, it will start showing the current GPS data when POS is pressed.

This similar to the problems I have been having in not getting the G model
to recognize my GPS III+.
I can't believe no one else complains of this!
Someone sent me a message to start the GPS BEFORE turning on the radio and
it seemed to do the trick- but I believe the radio firmware does have a bug
in this regard.

Ralph,

I don't have the problem you mention. If I've set gps to nmea, it doesn't matter whether I turn on the D7 first, or the GIII+ first.

The problem described in the snip below may have to do with plugging in the gps while the d7 is powered up. Manual warns against plugging anything in without powering down. I had strange problems related to that early on with my d7. Bet that when you "power the gps before turning the radio on", you're already plugged in and thus powering up the d7 after the plug is inserted.

Howard

Where can I find the RM GPS for $60? I've only seen them for $79.

Also, is there a web page with recommendations for inexpensive
trackers parts, ie < $150 5W HTs, <$100 GPS, etc?

My local club wants to put together about 10 trackers for club
functions.

Thanks,
Byon

Rendered body type: text/plain

I just joined this sig so if I am resurfacing old questions that have been previously discussed, please
 bear with me. Everything I know about APRS has been gleaned from reading WA1LOUs two books on the
subject.

I have noticed that my THD7A does not seem to have much punch for keying voice repeaters or APRS digis.
  I've tried the stock antenna and also have a Comet SMA 503 which may be a tad better. The stock

antenna and radio have been checked by Kenwood with no problems found. However, doing a very rough comparison with a crude signal strengh meter and comparing signal reports with other HTs there is a big difference. With an external antenna coupled through a SMA-BNC things work reasonably fine. Is this normal for this radio?

What are the current recommendations for a GPS?

Any recommendations for a mobile installation with the THD7?

Does anyone have any neat ideas to integrate APRS and ham radio into a high school physics class? I'm starting a second career, after 25 years in engineering.
If I can stimulate some interest, I'm all for it.

Thanks,
Dave WB2UTQ

54. [htaprs] Re: Slow turnaround at Kenwood East Coast

Rendered body type: text/plain

Dave,

I called Kenwood East last week before sending my D7A to see how long to expect the repair loop to take. The very nice lady on the phone put me on hold and checked with the technician. Instead of giving me a rough estimate, she told me on Thursday, 29-JUN-00, that the technician was presently working on radio's received from 13-JUN-00. So, that was about 12 working days at the time. On 06-JUL-00, I received an e-mail that they received the unit, gave me a tracking number, and stated that the UPS computer would notify me by e-mail when it ships.

With all of that information, I will look for my unit to arrive sometime after 27-JUL-00 giving it about 3 days to ship.

They were obviously doing quite a few upgrades when I called a few weeks ago.

Having worked in the service industry, it was always difficult to predict how long the cycle would take in repairing or upgrading equipment, because you never knew how fast you would get flooded with work at any given time. They got flooded with D7A's to be upgraded.

I am extremely satisfied how up-front and informative they were with me when I called Kenwood East prior to sending my unit. I did not expect the e-mail telling me they received it nor that UPS would notify me by e-mail when it ships. I was impressed!

Now I will patiently wait and finish my D700 GPS project with the unit I got from CommSurplus that is working great. More on that later...

>the GPS 35. I don't suppose it can do NMEA on both....?

Don't think it will do NMEA on both, but why not just use a splitter cable
to send the serial output to two devices? A "dumb" unit like a D7 or D700
does not need to talk to the GPS. Unless you are trying to display other
stations on the GPS (which a non-display GPS can't do anyhow) what is the
point in trying to send anything to the GPS engine?

In a setup where the computer/palmpilot/terminal device may talk to the GPS
still should not prevent you from picking up just the GPS output and sending
it to a second device.

>In my opinion, I feel that the evaluation kit is well worth it.
>
>You get all 4 mounting hardware units (complete with all hardware) which
>more than pays for the cost of the kit. In addition, you get the software
>that is necessary to program it. Any change(s) you may want to
>(eventually)make, such as selecting 9600 baud versus 4800, will require
>this software. And, since I wasn't sure which hardware mount I wanted to
>use, this alone paid for the kit, and now I have the programming kit.

Did not know that the "various mounting brackets" were a complete set of
mounting kits. When I was talking to Garmin about accessories (like mounting
kits, software packages, etc) they did not indicate, for whatever reason,
that all of the mounting kits were included with the software package. Good
to know though.

While the software may still be very useful, the unit as shipped from the
factory has worked as-is out of the box with both my laptop and KPC3+ based
tracker, so having this program is not necessarily critical (or required) to
using the unit.

Per http://www.qsl.net/n6qab/n6qabgps.htm it seems the GPS 35 may have
problems with the Kenwood units. I'll have to run some more tests, as I
usually use a Garmin GPSIII with my D7.

Darrell

G'Day All
I have just gotten into this APRS thing. I have a KPC-3 with version 8 firmware and a Garmin GPS-35, I run a Toshiba 486 SX 25 laptop.

1st - I believe there is a file that will allow me to run WinAPRS even though I have windows 3.11 - can someone let me know the name of the file...???

2nd - As a beginner can someone give me a list of settings to start with for either Ui View or APRS, I have not decide which one to run with yet.

Cheers from Rob

Rendered body type: text/plain

I have heard that the MDI (bought out by Motorola some time ago) KDT-9600
public safety terminal interfaces very easily and extremely well to the
Icom 2800 radio. Supposedly this combo is true Plug-and-Play ease of
interface and use; it is supposed to plug right into the TNC DIN connector
on the front panel chassis of the rADIO . But, does any one have the
pertinent interface SPECSXXXX so I can lash this up in my vehicle?

Thanks!

Larry

Hello,

A ham friend discovered that Target stores is selling a neat battery power unit
in their camping section. It is meant to run their battery operated camping
stuff. It has 2 cigarette lighter plugs for 12 volts (up to 15 A) and plugs
for 3, 6, or 9 volts as well! (up to 1 A). It contains a sealed lead-acid
battery, has a light built-in, and can be charged from a supplied AC adapter or
from the car. I bought one.

I had a chance to use it with the D7. The D7 was still sending posits
in the morning after running overnight.

It maybe alittle on the heavy side to carry (it does have a shoulder strap and
a carrying handle) but it should give extra life to the VC-H1. I should try
it with my Ricoh digital camera as it is known as a battery hog (due to the lcd
display).

Yes, but D cell alkalines have something like 5 times the energy density
of led-acid or NIcads. If I had to cary it, then 4 D-cells will give you
14 amp HOurs of life at 6 volts. That is probably 10% or less of the
weight and cost of the mosster you refer to below.

For one-time "missions", "events" or one-time-must-work" type applications
you just cannot beat Alkalines for power-to-weight-vs-cost...
Especially at the D cell level...

64. [htaprs] D7 Encoder Knob broke, AGAIN!!!!

From: "Eric A. Cottrell" <eac@shore.net>
Date: Sun, 09 Jul 2000 19:27:38 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-95588-2000.07.09-19.32.03--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

In May my D7A was dropped, resulting in a broken encoder knob, cracked sma
connector, and a chip capacitor running around loose in the inside. So I sent
it in for repair as well as upgrading. I got it back recently repaired and
upgraded.

I took it up on a trip to St. Stephens, NB and did some APRS. It worked well
as the Calais/St. Stephens area has an APRS pioneer that has put several
wides on 144.39 and runs 4 or 5 stations total!

While setting up the HT in my Augusta, Me motel room during the return
trip the HT got dropped again and the encoder knob broke. This time the
sma connector is okay. I have not checked the inside yet but the radio
still seems to work.

I still think the frequency encoder knob is too tall for the radio!
The part of the shaft that the knob slips on may look big enough but
that shaft reduces to half the diameter where it enters the encoder!
In both cases the shaft broke in the same spot, on the small diameter
portion of the shaft at the point where the shaft doubles in diameter.

I know that radios are not built like tanks but I find it amazing that
these drops did not harm the case at all but seem to easily break a
metal part. Not to bend it, but to actually shear it off. I am no
mechnical engineer but even I expect that when you stick a tall knob off
a unit with no protection that it is likely to have some force applied to it.
I am beginning to suspect that the encoder shaft was not designed for the
application that Kenwood put it to and Kenwood put a plug on the thing so
they would not have to change out the entire radio when it broke. They
knew that these things would break and I wonder if the repair backlog is not
just due to upgrades but also repairs of broken encoders!

I guess it is time to get out the tools and modify the radio so it will
not break the encoder. Because I figure in a few years the replacement parts
and labor will total the cost of a new radio.

The 35 does not do NMEA on both ports. Port 1 does NMEA in/ NMEA out plus

it's the port that you use for configuration changes. Port 2 does RTCM input
and binary (phase data, almanac etc.) output. There's nothing directly useful
for APRS in the port 2 output. I've built such a splitter cable, but with my
present needs port 2 is more of a curiosity than anything else.

>factory has worked as-is out of the box with both my laptop and KPC3+ based
>tracker, so having this program is not necessarily critical (or required) to
>using the unit.

You don't need any special SW to configure the 35. The downloadable manual
gives the command syntax, all you need is any terminal program.

>>Per http://www.qsl.net/n6qab/n6qabgps.htm it seems the GPS 35 may have
>>problems with the Kenwood units.

Too bad the problem wasn't specified, nor which particular TrackPak 35 model
was tried. They come in different voltage ratings for power input and serial
port parameters (RS232 vs. TTL for example). It's hard to imagine why it
wouldn't be possible to make use of the proper model of the 35 with a D7A
unless Kenwood goofed by not allowing for the known range of NMEA sentence
formatting differences.

See ya on the bird!

---------- Forwarded message ----------
Date: Mon, 10 Jul 2000 22:16:13 +0200
From: Johann Lochner

Sunsat will be in Mode J for the next couple of weeks (including the
voice passes). Earlier this evening it was configured to digipeat
both 1k2 AFSK (uplink 145.900 MHz) and 9k6 G3RUH (uplink 145.825 MHz)
packets at 9k6 (downlink 436.250 MHz). No other APRS services are
currently activated. Note that the ham services cannot be guaranteed
as some non-ham payloads take priority (especially during the week).

Kind regards,
Johann, ZR1CBC

Eric,

How do you manage to drop your HT? I don't know if I have ever dropped one with all the ones I've owned (*knock on wood* I don't want to jinx myself! hi!). I treat my TH-D7A in particular like I would handle the most delicate piece of fine china.

You say that the encoder shaft was not designed for the application that Kenwood put it to. Perhaps they could have used a stronger encoder. But then the cost may have been more, size may have been too big, etc. And I don't think Kenwood's design criteria was that the HT would be regularly dropped! The encoder works just fine and has no problem when you use it in the intended application: operate the radio without dropping it. Any radio no matter how long or short the encoder, can be damaged from a drop if the knob, antenna, switch, etc. is hit correctly. So I wouldn't blame Kenwood for my own clumsiness.

Now some may think I am flaming you here. I'm not really. I feel bad for you as I would feel bad for it happening to anyone. It's got to be a bummer for it happening twice. But I don't think Kenwood should be blamed for not making a "Motorola" style radio. Motorola does build them like tanks, but they cost two to three times as much and don't have all the features the TH-D7A has. By the way, the number one failure on a Motorola radio from what I understand is the antenna connection or antenna. Why? Apparently, a lot of police officers grab the radio by the antenna and use it as a billy club when they need to subdue someone!

Anyhow, back to my point: I wouldn't modify the radio and hack it up. You'll ruin any chance of it being sellable at a decent price, you'll make it so Kenwood won't fix it should something go wrong in the future and how knows what else may be wrong from the drop. Just cause it seems OK now, doesn't mean that it is OK. Rather see if Kenwood's parts division can ship you the encoder knob and try to repair it yourself. If you don't want to do that then send the radio back to Kenwood for a proper repair.

And when you get it back, treat it like glass. I know that "ideally" your should not have to do that to an HT, but we live in a world of compromises.

>

Hi Dave,

Well, let's start with a couple of things:

1.) Power out of the TH-D7A depends on how high your battery voltage is.
12V is max power.
2.) Power out of the TH-D7A may be less than other HTs you may own.
3.) Do you "hear" other repeaters OK on 2m? If not, you may have the VHF
AIP on which should normally be off. It's basically a front end attenuator
areas with high RF concentration.
4.) An external antenna will ALWAYS work better than a rubber duck.
5.) The HT has 3 power levels: EL,L and H. Make sure it's on H.

So given these factors, your HT probably works fine. It's probably just
differences between HTs, antennas, etc. A single band duck will probably
work better than a dual band duck, and so on.

> What are the current recommendations for a GPS?

How much money do you want to spend and what features do you want? Maps?
Color maps? Large display?? Basic GPS only?? The best and most reasonably
priced are probably Garmin's GPS-12XL for no maps or the GPS-III for maps.

>
> Any recommendations for a mobile installation with the THD7?

Sure. I had mine in the car for a long time. I used it on APRS and on 2
meters as I had a 440 mobile. I ran the HT into a Rat Shack 2m amp and then
to my duplexer and then the antenna. It worked great. The radio sat in a
"grip-matic" mount. I would DEFINITELY buy the TH-D7A mobile mount by RAM.
It is REALLY, REALLY, REALLY nice. HRO sells them.

>
> Does anyone have any neat ideas to integrate APRS and ham radio into a high
> school physics class? I'm starting a second career, after 25 years in
> engineering.
> If I can stimulate some interest, I'm all for it.

Well, let's see what sort of physics stuff:

* Wave propagation
* Basic radio theory
* Physics of flight with ham radio on ballons.
* Distance = Rate * Time -> Gee, you could use the GPS date for getting the
speed and direction.
* Vector studies: You have a speed and you also know the direction an
object is heading so you have a velocity vector. You could do all sorts of
stuff with that.
* Weather related physics with weather spotting.
* Space communication and orbital dynamics with the pacsats digipeating
APRS.

I could go on, but I am tired and gotta go to bed. Suffice to say, I think

you have a LOT of potential with physics students!

You could try some Lithium AA batteries. They cost more, but weigh less and
last a lot longer.

>
> Can anyone point me to a good source for a 12v to 6v converter to use with

Well, Kenwood does have an adapter as Clifford pointed out.

Or you could use a linear regulator like an LM-317 and quite easily build
your own regulator to six volts. All parts are available at Rat Shack.

Lastly, 5 volts would probably work OK. Your batteries will hit five volts
sometime before the unit dies.

I purchased, at the local Batteries Plus Store, a small switching DC to DC converter under the product name of "Power Line." Model Number is UCC-2000. I bought it about 2 years ago, and don't know if they still carry it. I think it was less than $20.

It's rated at 2 amps maximum at any voltage (unlike the RS High Current DC to DC adaptor) and takes 12-15 volts DC in and outputs 3/4.5./6/7.5/9/12 Volts DC regulated. Sounds like just the ticket for the VC-H1.

I chopped the lighter plug off mine and installed an obligatory Anderson Powerpole. The other end terminates in the little two pin connectors identical to the ones sold at Radio Shack. Mine came with a good selection of right angle adaptors. The unit is about the size of a computer mouse and has built-in storage for 5 or 6 different DC plugs. The design appears to be pretty robust, as mine has not failed after two years of use. Another nice feature is the voltage selector switch is recessed, so it's fairly difficult to accidently switch voltages, but sometimes it's hard to tell what detent the switch is on. I always check mine with a multimeter to make sure I've selected the right voltage and polarity when changing devices.

I most often use it to power my AR-2700 scanner and Mini-Scout frequency counter in reaction-tune mode, as the scanner really seems to eat batteries when the serial port is active. I bought a Radio Shack "Adaptaplug" Y-splitter (273-1640) so I can power both from the UCC-2000. Works Great.

>
>Configuration.

For a configuration change you will need a different connector from the stereo plug, unless you want to use a stereo jack to DB9/25 conversion cable.

My main point was that you probably don't want to have two actively talking devices trying to control the GPS at the same time. A full duplex (both the serial TX and RX lines) could be run into a computer, palm device, etc. while only the GPS's TX line is split off to the extra D7/D700 devices. Unless the D7/D700 has a way to send such configuration info, then I say again, what is the point to connecting the GPS RX line of a no display device to the radio?

>>>Per http://www.qsl.net/n6qab/n6qabgps.htm it seems the GPS 35 may have

I believe your last comment is exactly the problem, per the following quote from the web page:

"A summary comparison of each of the GPS receiver's $GPGGA sentence is provided below. See a pattern? Notice the number of decimal places in each of the position reports. The highlighted underlined numbers. The units that work with the TH D7A display three decimal places. Others, which don't work,

display more than three, or less than three decimal places."

Furthermore, Ralph Fowler emailed me the following:

"I used a GPS35 with my D700 all during my CA trip for 2 weeks.
Worked fine.

Even works on the D7(G) as long as you get past that new bug in the D7
where the GPS has to be on before the D7 is turned on."

Although I have not actually tried using my GPS 35 on my D7(G) yet, I
suspect it will work just fine. What is still unclear to me is if the "G"
version is what may have fixed the extra digits problem, although it seems
to have introduced a new powerup problem.

I noticed that the cost is $60 plus shipping. Do you send a credit card
number, a check, or what? How do you pay for the upgrade?

Thanks,

Tom NY4I

There is a one piece regulator that does 6v out. Try Mouser(Catalog 601 p
39 511-L7806ACV TO-220 +V Regulator 1A 6V)or Digi-Key . I think 1A should
be enough. Call or e-mail if need help.

I use a gps-35hvs (high voltage, serial out) on my D7A and it worked fine
out of the box.

Lee N4TCW

Too bad the problem wasn't specified, nor which particular TrackPak 35 model
was tried. They come in different voltage ratings for power input and serial
port parameters (RS232 vs. TTL for example). It's hard to imagine why it
wouldn't be possible to make use of the proper model of the 35 with a D7A
unless Kenwood goofed by not allowing for the known range of NMEA sentence
formatting differences.

>>pattern? Notice the number of decimal places in each of the position reports. The highlighted
underlined numbers. The units that work with the TH D7A display three decimal places. Others, which
don't work, display more than three, or less than three decimal places."

The list of upgraded features advertised by Kenwood contains a setting for GPS Unit Selection, where you
 can set the number of digits behind the decimal point that the D7G should expect from the GPS.

>>"I used a GPS35 with my D700 all during my CA trip for 2 weeks. Worked fine.
>>Even works on the D7(G) as long as you get past that new bug in the D7 where the GPS has to be on

before the D7 is turned on.
>>"Although I have not actually tried using my GPS 35 on my D7(G) yet, I suspect it will work just fine.
 What is still unclear to me is if the "G" version is what may have fixed the extra digits problem,
although it seems to have introduced a new powerup problem.

The D7G might have a hidden feature here. If the GPS Unit Selection is set for the wrong number of
digits behind the decimal point, the device shows all zeros for position, but if you power it up to an
already warmed up and sending GPS you get data? Maybe the D7G samples the GPS port on startup and
autoadjusts to the form of data it finds there, whereas if you start a GPS input with the radio warmed
up it looks only for data in the form you preselected?

Hams:

This is my first attempt at Digital Sat operation.
Im am attempting aprs via sunsat using DM-D700 mobile.
Im set for 9600 up/dn & current sunsat uplink/dn 9600 freqs.
Do I need to set anything special in the path or uidigi?

Im set for same as land based aprs, other than freqs & Baud rate.
Relay, wide, wide.

Will this work through the sat?

Well I guess you are one of the lucky few then. I do not expect the radio
to be built like a tank and be able to withstand a drop onto a concrete
floor but it seems to me that the encoder shaft is too delicate compared to
the rest of the radio. I got feedback before from more than one person that
they also broke or bent the encoder shaft on the TH-D7A.

> You say that the encoder shaft was not designed for the application that

I find it interesting that two out of two times it seemed to find the right
spot. Maybe the radio tends to be top heavy thus landing on the knobs.

>
> Now some may think I am flaming you here. I'm not really. I feel bad for

> lot of police officers grab the radio by the antenna and use it as a billy
> club when they need to subdue someone!

Well I am not comparing the D7A with Motorola. I have a W2AT HT that has knobs
on top of the radio. It has been dropped a few times. The knobs and the radio
still work. I suppose the W2AT is now one of those old radios that would cost
$1200 if ICOM was still selling them.

If ICOM came out with a APRS radio then I would consider selling the TH-D7A
and buying the ICOM. APRS built-in is the only thing that keeps me from
selling the TH-D7A but it is getting close to the sell off point.

> Anyhow, back to my point: I wouldn't modify the radio and hack it up.
> You'll ruin any chance of it being sellable at a decent price, you'll make
> it so Kenwood won't fix it should something go wrong in the future and how

> doesn't mean that it is OK. Rather see if Kenwood's parts division can ship
> you the encoder knob and try to repair it yourself. If you don't want to do
> that then send the radio back to Kenwood for a proper repair.

Well I did not find any parts floating around inside so I ordered a new
encoder/volume control. No it was not the plastic knob that broke (in fact
there is hardly a mark on it) or the plastic internals of the encoder but
the metal shaft that broke. The rest of the radio holds up very well except
for the encoder shaft. If I did not know better I would think that the shafts
were snapping not from being hit on the knob directly, but due to the weight
of the knob and the large diameter portion of the shaft. I find it strange
that the metal encoder shaft would break so easily while leaving the plastic
portions undamaged.

The modification I am thinking of is to get a shorter knob for the encoder
portion. While it may no eliminate the problem, I think it will make a
smaller target.

>
> And when you get it back, treat it like glass. I know that "ideally" your
> should not have to do that to an HT, but we live in a world of compromises.

If that is the new reality, then I guess I need to sell the TH-D7A and go
back to using the ICOM W2AT then. The W2AT seems to be able to take reasonable
punishment and I would be more comfortable with it in a emergency situation.
The W2AT has knobs that stick up from the top of the case and I have managed
not to break them off. I think the secret is that ICOM did not make the
knobs as tall as the one on the TH-D7A. The ICOM controls use the same shaft
sizes as the TH-D7A.

I also have a D700A as well. Several times my mounting let go in the heat
and the D700A control head bounced around without damaging the shafts or
knobs of the controls.

I guess the reliablity and dependablity claims of Kenwood as well as the
number and letter soup on their web site does not really mean anything when
applied to the TH-D7A.

> ... how to program the D7A(G) to receive all messages?.......
> Right now the MSG GROUP is ALL,QST,CQ,KWD

Add the wildcard "*" to the list.

ALSO, everyone should remember that you can QUICKLY change paths by using
abbreviations such as R, W and #. I find this very userful when changing
between UOSAT5 or SUNSAT calls and Terrestrial DIGIs. Examples:

R,W,W   works the same as RELAY,WIDE,WIDE etc...
R,3   works the same as RELAY,WIDE3-3
        (or maybe I have that wrong and "3" will only cause it to use the
        (SSID method of digipeating. I cant test it here because we dont
        (have WIDEn-N around here)...

Maybe its R,W-3 ?... whatever....

As a commercial portable tech I would like to say that any user
who expects his $400.00 portable to bounce instead of break needs a reality
check. As for Icom, having worked on a lot of them, Kenwood wins in my book
ANY day. NO portable made for amateur use is designed for dropping. The
fact that the Icom you own does means you are maybe luckier. I know of many
dead ICOM HT's because they were dropped one to many times... To justify
dropping a radio as OK seems absurd. Your computer would likely not
withstand a fall, why should you think a portable should ? drop your palm
pilot a few times too, and see what happens.....
         I am sorry your encoder shaft broke but in my opinion that will be
a cheap repair for your negligence, A ceramic filter , lcd or cracking a
board would likely cost 10 times that..
         You may want to consider a heavily padded case for the radio as
from personal experience, they afford a great deal more protection than any
other alternative sans not carrying the radio.. Anyone who relies on a
piece of equipment for emergencies owes a little more than cursory
attention to that piece of equipment. Dropping is not included on my
preventative maintenance schedule.... sorry if this is harsh but I happen
to see a lot of radio ABUSE and as far as I am concerned, dropping does fit
in that category... I think Kenwood has some of the best radio equipment
for the price on the planet, Maybe the next d7X will be better but for now
as users we need to be a little more careful and expect repercussions from
"accidents", not blame the manufacturer..
                                                        73, Doug KB8GVQ

Folks, I use my high tech toys in extreme conditions all the time and have
done very little damage to them because I take precautions.

I use my radio and GPS on while hunting, while backpacking and climbing
mountains. I have not seriously damaged either one of them yet and yes, I
use the TH-D7A all the time and love it. The precaution I use on my
equipment is that I add a securing device to the radio and GPS straps. I
use a key swivel snap device (I don't know the exact name) that is made of
plastic and costs under $1. It works great. Whenever I clip my radio on my
belt, I clip the snap to my belt loop. If it is in my shirt pocket, I clip
it to the button hole or just the fabric. So far I have been lucky and

whenever it fell off, the snap held it securely and prevented it from
hitting the ground.

Just a simple security fix. I highly recommend it for all you small fragile
toys.

I also use this radio while hunting in our severe rainy weather conditions.
I put it in its own raincoat. I use a ziplock sandwich bag and poke a hole
through the top and then screw the antenna on through this hole. I have the
strap come out the bottom of the bag through the ziplock portion, so as long
as the radio is upright, the water will not leak in. Just another simple
trick to protect your radio.

Hello,

I fixed radios for a living as well a long time ago. I seen radios run over
by cars and trucks and I do not expect a radio to survive some of the abuse.
I have own several HTs as well (both ICOM and Kenwood). I do not drop them
all the time but accidents happen. I guess I am lucky that I had 4+ HTs
that survived.

I doubt that a heavy padded case would help unless it had a roll bar that
came up and protected the knobs as well. The case has actually survived
and does very well. That is what is upsetting. The rest of the radio
seems to take knocks and still works. The encoder shaft is the weak link.
I still think the encoder knob is too tall for it's supporting structure.

I entered feedback into Kenwood and they did offer to send a warranty
letter so I can get the radio repaired at no charge. I had already

ordered the part and would rather spend $25 to use my radio rather
than send it off for two weeks plus to get repaired. The only reason
I sent the radio in before was due to the loose chip capacitor. I do not
have surface mount repair capabilities.

I may be unreasonable but I am not talking about drops onto concrete,
or stuff that destroys the... Oh well....
Maybe I should just shut up as it seems like the list is so gung ho
for Kenwood that people jump on anyone who criticizes Kenwood radios.
Sorry I brought the subject up. Kenwood only does perfect designs. So
perfect that they do not need any suggestions. It is always the user's
fault if it breaks. Enclose the radio in a nerf case! Kenwood is King!!!

89. [htaprs] SUNSAT APRS Pass

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 11 Jul 2000 21:57:36 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-95957-2000.07.11-21.02.50--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I finally remembered to catch a SUNSAT APRS pass while I was driving home
from work and copied N4ZO, WB8WOR, WB4APR, N5ZNL and N9IDH at about 2355
UTC Tonight on my Kenwood D700 Mobile.
All packets were 9600 on the donwlink. Was anyone uplinking at 1200?

I tried 1200 during the first part of the pass, but since the D700 cannot
do cross-RATES (1200 up and 9600 down), I couldnt see if the 1200 was
getting through and coming out on 9600 or not.

I did see one station say he was using 1200, but that could have been an
old STATUS packet and he changed like I did to 9600.

The UHF 9600 baud downlink was OK on my 3/4 wave 435 MHZ vertical
(20" mobile whip), but never got above 2 S units. I think it was a 40 deg
western pass for me (in Maryland).

I only saw my own packet ONCE. Did anyone see any more hits?

If you are uplinking on SUNSAT APRS (145.825) please include some info
in your STATUS on your uplink situation, such as POWER, ANTENNA and RATE
so we can evaluate uplink success raates.

Examples:

5w HT into duck
50w 1/4 whip 30sec
50w 3/4 omni
5w HT to ARROW
5w to Arrow 1min
5w to 1/4 whip 2min

Remember, you do NOT have to waste bytes saying you are using a D700 or
D7, since that info is already encoded in every packet anyway.

Thanks,
de WB4APR, Bob

Rendered body type: text/plain

Eric , There is a very large difference in the construction of a Kenwood
amateur HT and say a Motorola HT1000,or an EGE MPA, the latter(s) of which

would withstand falls much better, with knobs just as tall or taller than Kenwood. The difference is a case which is over an eighth of an inch thick and made of something like LEXAN,and/or with a die-cast aluminum frame , it also weighs in at about a pound or 2.. 10 maybe even 5 years ago, most portables were considerably larger than today,and the micro miniature radios we now have at our disposal unfortunately give something up.. namely ruggedness.. What we call Kop Pruf.... no malice intended, just a fact of life. A large discrete component radio gave justification to a heavier case, byproduct.... better drop-ability. Such radio's still exist, but not in the $400.00 dollar area.. least of all, not dual band, wide band and with a modem built in.. Such a HT600/1000 or such with those capabilities would probably sticker at $2000.00- $3000.00 and probably take the punishment you expect.. We have to live with reality.. I applaud Kenwood's offer to repair under warranty, they are a good company.. , This does not however imply you are or were justified to ask for such in my opinion..

As for a Kenwood Centric list... it IS.. TMD700, and TMD-7a are KENWOOD products. I am not ashamed but Proud of that fact.. IF and when ICOM and Yaesu ever build a radio dedicated to APRS, I will evaluate it fairly.. and give it equal attention, but in the mean time, Kenwood is the ONLY vendor in the market making dedicated APRS radio's... nuf said...

This is sensible, not eccentric... I think you have expectations beyond reality... as for not criticizing Kenwood, lots of criticism has been leveled here in this group, alot deserved, but blaming Kenwood for your problems IN THIS CASE seems undeserved.

I repair and sell equipment from many vendors, Kenwood is not on my platter, for reasons I will not elaborate on. My comments are from the service side of the house as I do service them. as well as 6 or so other vendors. Kenwood is sitting about SECOND chair in the Commercial Conventional Products in the US today, as far as market-share .., They DESERVE that slot with a great product line...That may change some day, but right now it is justified, our amateur support will likely bring more and better products from them..

As a side note, the #1 part I replace (besides batteries) is On/off Volume controls. almost every "M" Potrable that comes through the door needs a new one. The way a vendor helps us is by making it easy/cheap to do such repairs.. There are some radio's which require all but complete dissection to change the user controls.. Thank god most make it easier so the customer gets it quicker/cheaper.. That is reality.. you are not different than most users, my point was you have too great of expectations, for what you are paying for.. a portable in 1970 cost $2000.00.... with inflation, it should be close to $8k, or more , we sell similar technology today to that $2k radio, for about $100.00 in today dollars.. something is left out.... you be the judge on which way you want it... .. 73, doug kb8gvq

I saw you, Bob...

I copied N4ZQ, N5ZNL, N9IDH-3, and WB4APR-3

I saw your message saying you finally remembered a pass, and your posit.

I was running 9600 baud Kenwood TH-D7 (G), into an MFJ dual-band mag mount
on the roof of my car.

73,

TomB WB8WOR

93. [htaprs] 3/4 Wave Vertical Omni

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 12 Jul 2000 10:11:46 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-96114-2000.07.12-09.17.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For the mobile Satellite operator looking for an Omni, I finally did a
real-world antenna plot of a 3/4 wave 435 Mhz WHip over a car roof
to see how well it matches the EZNEC predictions. The results confirm the
almost 8 dBi gain from about 30 to 80 degrees elevation:

REAL PLOT: http://web.usna.navy.mil/~bruninga/g3q435.jpg

EZNEC PLOT: http://web.usna.navy.mil/~bruninga/gainplot.gif

I did this by building a 1575 MHz scale model of both the antenna and a
miniature car roof and connecting them to a GPS receiver. Then ran the
GPS all night with my SIGPLOT.BAS program that then plots the GPS signal
strength of all satellites for 12 hours from ALL azimuths and ALL
elevation angles. THus you get a calibrated signal source over all the
sky and get a REAL plot of the actual antenna pattern.

Tonight I will change the model to do a simple 1/4 wave vertical to see
how well it fills in the low angle stuff below 30 degrees. BUT I doubt it
will do any good for mobile satellite work, because:

  1) The 1/4 will only have about 5 dBi (3 dB worse than the 3/4)
  2) The satellites will be further away for another 3 to 6 dB loss

Combined, the loss is 6 to 9 dB compared to the 3/4 wave and there is just
not enough signal from the PACSATS to be heard by any system reliably at
that level.

Probably the only way to fill in the low angle is to go to a high
gain vertical (to get 9 dBi below 30 deg) and switch between the two.
during each pass. But given the complexity, I just stick with the 3/4
wave (20" vertical) since it is inherrently dual band being an excellent
1/4 wave 2 meter antenna as well for the uplink. THus, your 2meter 20"
whip in the center of your car roof will serve very well as a mobile
satellite antenna whenever the satellite is above 30 degrees, and most
mobiles cant see much below 30 degrees anyway due to trees.. (back east
anyway...)...

For APRS messaging, though, this is all you need, since the APRS SAT/Igate
will only send your traffic to your mobile when you are within that cone
of coverage, (APRS always knows where everyone is) and conversly, your 2m
mobile uplink has a 18 dB advantage so your outgoing traffic can get into
the satellite at ANY elevation angle...

To see the entire discussion of mobile satellite operation including the
discussion of these antenna plots see:

  http://web.usna.navy.mil/~bruninga/astars.html

Come join us on SUNSAT and any other satellite that may have UI
digipeating enabled...

Anyone on APRS anywhere can uplink to SUNSAT in its present APRS mode!

If you will be traveling outside the normal APRS infrastructure, be
sure to consider switching your tracker over to 145.825 normal 1200 baud
and set your path via SUNSAT digipeater during the mornign and early
evening passes.
(Please Set to nothing less than 1 minute rate please)

These occur sometime between about 7 to 10 AM and PM local daylight
savings sun time everywhere.   The downlink is on 436.250 +/- 9 Khz and
using 9600 baud which will just sound like a noise burst. But if anyone
is running as an IGate, then everyone on APRServe will see ya...

WARNING! The CENTRAL USA pass in the evening will often be VOICE, so for
us EAST coasters, it is the later pass. For the Left Coasters, it is the
earlier pass. so LISTEN on 145.825 first during those passes before
transmitting. But since the VOICE mode is mode B and the APRS is curently
mode J, then even if your tracker does transmit a few accidentally, you
will be on the donwlink and so noone will hear you unless they are within
5 miles of you...

 See ya on the bird

I copied 4 stations on the 20:55 pass using a D700 & 2m 5/8 whip.
I had my via set to APRSAT which I discovered is wrong,
so I did not uplink.

I heard:
N9IDH-3
WB4APR-3
N4ZQ
N5ZNL

Reset my via for SUNSAT, gonna try again tonight!

Good afternoon everyone. I guess I should of informed the group that my
PACGAT has been down for a few weeks. I had to send my Yaesu FT 847 in for
repair for a multitude of problems. I've been on business travel for 4 out
of the last 6 week's anyway. I've been too busy to even work some passes. I
should get the PACGAT up in a few week's, I will let all know here when I'm
up and running. I have a D-700 in the shack that I will temporally use in
the meantime(with a reduced throughput, due to manual Doppler, and satellite
tuning), when I get back home that is.

Rendered body type: text/plain

Dear Kenwood Customers,

Kenwood appreciates your comments regarding our radio products. It is true that Kenwood radio designs are both innovative and within $ reach of most amateur radio hobbyists. Production costs are always an issue when introducing a new product to the amateur market. Yes, when compared to commercial grade equipment (Kenwood LMR or Motorola) production costs are not as big a factor as the higher standards for bullet proof radios (pun).

As for the encoder knob shaft being broken, our product planning teams and engineers are now aware of this, thanks to the people on this list. On behalf of Kenwood I would like to thank everyone here for participating, because of your comments Kenwood is able to react quicker to these kinds of situations to provide solutions or better products in the future. Kenwood is not a perfect company and will continue to provide products that will enhance our hobby.

Keep up the good work! If you should have a similar experience with a broken encoder, call our customer service department and let us know about it.

99. [htaprs] Motorola 520 Work Station MDT & Icom IC-2800

From: "Larry Zanella" <larry.zanella@attws.com>
Date: Wed, 12 Jul 2000 14:24:18
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-96164-2000.07.12-14.28.57--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have interfaced a Mototrola 520 work station to my Icom IC-2800 for 9600 packet operations in my vehicle. I have a question on the back lighting on the keyboard special keys.

Does anyone else on this list server have experience in using the Motorola 520 work station, even if it is in a full-blown, current commercial environment?

If so, I'd like to email you a jpeg of my mobile installation, along with my keyboard question (it's sort of a strange phenomenon, so unless you have actually used a 520 in a vehicle at night, you probably won't know). I'd like to compare notes with another user, before pursuing it with Motorola.

Thanks!

Larry

Rendered body type: text/plain

> Anyone on APRS anywhere can uplink to SUNSAT in its present APRS mode!

Indeed. I managed to get a packet or two through last night (Wed 0930z pass), well, as least, I heard a 9600bps packet in response to an uplink attempt at 1200. Unfortunately, due to a local birdie a few kHz above

436.250, I am only able to check my downlink at the start or the end of the
pass, and have to rely on signal reports for any other stage of the pass.

Anyone copy VK3JED-1 on APRS? The My beacon contains an email address,
which can be used to send signal reports.

>
> If you will be traveling outside the normal APRS infrastructure, be
> sure to consider switching your tracker over to 145.825
> normal 1200 baud

I thought 145.825 was running 9600, and 145.900 was 1200.

> WARNING! The CENTRAL USA pass in the evening will often be

> they are within
> 5 miles of you...

No, the voice passes will be Mode J also. I had word of that myself on at
least two occasions from the Sunsat team directly. There are no voice
passed this week, but from this weekend, it looks like they will adopt a 1
pass per day schedule for the major regions.

One thing to conisder is that it must be over a "large" ground plane such
as the roof of a car. It requires the ground reflection to get the needed
gain. A normal "ground plane" antenna which is only composed of "radials"

will probably be 3 dB worse. SO will a 20" whip on an HT. It is also
going to be 3 dB worse than the same whip in the center of your roof at
these elevations above 30 deg...

Just some thoughts...

Sounds quite useful. I must see why my attempt to use a 2m 1/4 wave failed
on 435 MHz. Time to get out the FS meter. :-)

> Probably the only way to fill in the low angle is to go to a high
> gain vertical (to get 9 dBi below 30 deg) and switch between the two.

I think a switched system is the only way to get the below 30 deg coverage.
Depends on one's requirements. As you say, the higher angles are fine for
APRS work.

> whip in the center of your car roof will serve very well as a mobile

> (back east
> anyway...)...

Hmm, here in Melbourne, 10 degrees is usually visible from a mobile. We
have quite flat terrain, and the western half of the city (where I'm usually
mobile) is built on a basalt plain, so the only limitation on the horizon is
the houses and the odd tree. Further west, it's open grassland with horizon
to horizon views from a mobile. :-)

Rendered body type: text/plain

Living in the central US has it's advantages: two great SUNSAT passes last night. I was going to post a list of the stations that I heard, buy my TH-D7A(G) was acting quite odd: Every new stations I heard completely filled the LIST. For example, I heard W8UC-8, and when I looked in the list, ALL 40 stations were W8UC-8. Then, when a new station was heard, (N4???), ALL 40 entries in the list would suddenly shift to N4???. I thought this might be limited to just split ops, but when I started off the morning commute this AM, the same thing was happening on "normal" APRS.
  Solution was to do a DELETE ALL on the list, and then things fell back into place. I'm a little dissapointed that I don't have a record of the 15 or so stations I heard on the two SUNSAT passes last night, but I'm glad the radio recovered. For our Kenwood Service Rep lurker, this might warrant some checking with the firmware guys... Thanks.

BTW, GREAT tropo ducting this morning across the midwest. I'm hearing stations as far away as 700 miles through just one digi (which is 200 miles south).

Rendered body type: text/plain

Hi APRS Gang --

     I was in my local REI store recently and saw the new Garmin eTrex Summit GPS. It comes in a package which is the same size as the eTrex and uses the same accessories. In a joint-venture with Suunto, Garmin has equipped the eTrex Summit with a built-in electronic compass which is accurate when the instrument is motionless or moving slowly. After it accelerates above a certain threshold, the regular GPS compass function kicks in. The eTrex Summit also has a built-in barometric sensor. Both the electronic compass and barometric sensor can be calibrated, but I don't know how the latter interacts with GPS elevation calculations. For example, inside a pressurized aircraft I don't know whether the user can switch between barometric and GPS elevation readings. There are some related track features which display elevation profiles. I hope that Garmin has corrected some glitches in its implementation of SI (metric) units which are present in the Summit. I was assured by a public relations person at Garmin that they would make appropriate changes. Perhaps these software corrections can be downloaded now. The Garmin Summit retails for about US$230, almost twice the eTrex price. But there's more:

     An REI staff member told me that more advanced and more expensive model of the eTrex Summit will also be released which includes all of the eTrex Summit features, plus the capability of displaying downloaded map data. This should pose some interesting possibilities for the APRS fraternity.

Hello all,

> > I copied 4 stations on the 20:55 pass using a D700 & 2m 5/8 whip.
> > I had my via set to APRSAT which I discovered is wrong,
>
> APRSAT is supposed to work also, but SUNSAT always does...

APRSAT only works when other APRS transmissions (posits, telemetry,
bulletins, etc.) is enabled. In the meantime SUNSAT should work for
both 1k2 and 9k6 uplinks.

Kind regards,
Johann, ZR1CBC

>Tony said:
>Anyone copy VK3JED-1 on APRS? The My beacon contains an email address,
>which can be used to send signal reports.

Im in the same boat. I was in the house and did not see if my packet
got recignized by the sat or not. I was checking APRS-serv to see if
any of the stations I copied on my log were showing up, and I did not
see any of them listed. Is there a sat-gate for Sunsat? Am I looking
in the wrong place? Did anybody copy N3SDO-1 ?

By the way, is the www.aprs.net down?

Oddly, on my QTH rf-aprsdos setup, I did see a piece of my callsign popup
at my work coordinates (last stored GPS position) as a circle icon.
" O (SDO)si "
And when I clicked on it, APRSDOS only gave me the lat & long,
and the word 'FADE'. That is the first time I have ever seen that.

Different subject... messaging across different I-Gates or digis / email
Say my QTH N3SDO-2 wants to send to N3YBE /mobile 8 near michigan, but
I don't know what I-Gates or Digis he is near. Can I message him, how?
We have an Igate (w3vc) here in pgh, and a Digi (w3exw) that sometimes
gets into Eastern Ohio and Maryland.

Email:??? I saw a paragraph on sending email on WB4APR's web site,
but not sure if this is an experimental Email gate, or if its a full
service gate?

112. [htaprs] New APRSdata version

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 14 Jul 2000 14:06:06 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-96575-2000.07.14-13.11.36--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There is a new version of the APRSdata.EXE program. As you know, this
program runs on a DOS PC and automatically feeds Satellite PASS data to
all D700 and D7 HT's and Mobiles in the area so that they need no prior

knowledge to operate through any of the 7 or so FM satellites...

APRSdata also responds to QDOS Queries to provide local information about
the nearest objects, locations, or information included in the Query...
such as HAM Stores, Wrecks, Digis, Gates, Hospitals, EOC's, CLubs,
nets, etc..

Here are the new changes in this version:

1) It can be configured to automatically convert raw remote WX stations
    data to APRS format so that those stations will SHOW on D7 and D700
    mobiles in the area. Currently Mobiles wont see this info...

2) Other minor tweaks:
    a) Now has a NEXT (-) command so you can see the "previous" 2 hours
        of satellite passes (that you may have missed)
    b) Fixes bug that caused two APRSdata servers in overlaping areas
        fromn canceling each others Satellite Objects.

Download ftp://tapr.org/aprssig/dosstuff/APRSdos/adat-exe.zip

Bruce:

I'd read of another GPS with an aneroid barometer, some Magellan
model perhaps. I don't know how true this is but I was told or
read that they changed the damping of the altitude computation,
more damping when the aneroid change and GPS altitude change
disagreed, less damping when they agreed. This was intended to
minimize altitude error back in the pre-cambrian era, so long ago,
when we had SA.

Given product cycle duration expectations, this GPS was likely
designed when SA was an issue. (AND IT CAN BE AN ISSUE AGAIN!!)
Who knows...

114. [htaprs] APRS Symposium at DCC

From: Steve Dimse <sdimse@earthlink.net>
Date: Sun, 16 Jul 2000 09:19:57 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-96842-2000.07.16-08.25.39--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Once again it is time to start planning for the APRS Symposium at the
Digital Communication Conference. It will be held Friday, Sept 22, 2000
in Orlando. More info on the conference is available at

http://www.tapr.org/dcc

This is as close as APRS comes to a national convention, past years have
drawn most of the movers and shakers within APRS. If you love APRS,
you'll love the Symposium!

The APRS Symposium will run roughly from 1PM to 7PM, exact times to be
determined. Undoubtably the usual suspects will be presenting, but I
especially want to encourage people that haven't presented before to do
so.

Anyone (including the usual suspects, I will not chase you down this
year) that will be there and wishes to present should notify me within
the next week, including the topics you wish to present and the amount of
time you would like.

If you aren't going to DCC but have something to share, consider
submitting it for publication in the proceedings anyway, it is a good way
to get information published. Deadline is August 7, details on submission
are available at the above DCC web site.

See you there!

Steve K4HG

upgraded from winaprs 2.2 to 2.4.6

got a new tmd 700a   filled out the ack message in winaprs and told
winaprs to do a ack, but when i am sent a packet winaprs won't ack

any ideas on what i am doing wrong?

the tmd 700 a standing alone off the pc does its own ack ok.

G'Day All
Over here in Adelaide (Australia) we are just starting to get APRS setup and
running - I have an MFJ-1270B that has been put aside for digi use so I
would also be interested in the setup information.

FYI....

I contacted Garmin about this unit, in that I was VERY interested in
the flux gate compass. If it has the compass heading in the GPS/NMEA
string, I would have bought one the minute it hit the stores. But,
much to my disappointment, the Fluxgate information is only available
on the display..

Oh well....

Hi All,

I've just uploaded by tracking program to my website.
The program will configure and tune your TM-D700 to
follow the doppler for SunSat and UO-22.

It includes realtime tracking thanks to some hard work
by Alex G7JGQ who wrote the tracking control used by
the program

Follow the URL in the signature to my Packet website and
select Sunsat from the left hand menu.

Great work regarding the D700 Doppler tuning for the APRS Satellites.

Now, how do we take the output of the D700 TNC and feed it into an IGate
so we can get on with teh worldwide SUNSAT/Uo22 IGATE system? My APRStk
will do this too, but I have no way to feed the downlink into APRServe..

Maybe the Sprouls or Brent or Steve or Dale can incorporate this into
their Igate code somehow?

I made two more slight tweaks to APRSdata that will serve out Satellite
OBJECTS and Schedules to D700 mobiles and D7 HT's in your area. This
version was posted Sunday afternoon.

The LIST-KEPS command now shows the Julian date so you can see how old
yoru keps are.

It also cleans up how the DX ALERT message looks on the mobile's D700
screen...

You might want to consider including my on-air format for exchanging NASA
ONE-LINE Elements. Once every hour or so, or on demand as part of its
QUERY-SERVER function, my APRSdata program can send out a
single packet ONE-LINE Keplarian Element set. All stations with older
elements can capture this packet and update their elements
automatically...

Correct, I would assume that could be taken care of in firmware. Heck, the eMap now allows NMEA-in.

I believe the NMEA compass string header is: $HCHDM

The only NMEA electronic compasses I can find start at about $250. That's as much as a new GPS.

Thought there might be some interest here. Precision Navigation has an electronic compass (which can be hooked to a Parallax Basic Stamp to give NMEA serial output - if you know the format....) for $50.00. Weighs in at 0.4 ounces and 1.5 x 1.5 inches. I have one and they work pretty well. They are accurate to within +/-2 degrees and have one degree resolution.

Here are some links:

Manufacturer's product info:
http://www.precisionnavigation.com/vector2xmain2.html
Interfacing with a Basic Stamp:
http://www.phanderson.com/printer/compass/compass.html
Where to find info on the Basic Stamp: http://www.parallaxinc.com/

I'm aware of the PN unit - here's the problem: The Vector 2XG with
mechanical gimballing ($100) only allows for a + or - 15 degree tilt.   If
you think about it, thats not much. Certainly if you consider roads
surfaces (bumps, grades) or g-forces encountered while turning or
accellerating, the unit is going to be torqued more than 15 degrees while
driving - unless you are driving on a perfectly flat, well-paved road. I
don't see many roads like that around where I drive.   It would be worse on
a boat.   What one needs is a 3 axis electronically gimballed unit. That
jumps the price to $700 and up for a PN OEM electronic compass module.

Also the Vectors have no display. For $250 I can get an electronic marine
compass from KVH, electronically gimballed - accurate up to + or - 25
degrees (shock stabilized) with selective damping. This unit has a backlit
display and NMEA out.   It is designed for powerboats, they also make a
unit for sailboats which can handle larger tilt angles.

The Precision Navigation units look pretty neat though and I wouldn't mind
having one to play with, but I'd rather put the $100 towards a KVH, or
better yet, a GPS that integrates an electronic compass.

Mark

Last week I posted the results of a 435 MHz 3/4 wave vertical whip
satellite antenna (2m 20" whip) on a scale model car roof. Last night I
re-ran the test using a standard 1/4 wave vertical so I could get a
benchmark for comparison.

The 1/4 wave did have a better pattern at low angles down to about 10
deg, but the 3/4 outperformed it everywhere above 27 deg by 3 to 4 dB or
more. Since the satellite is closer there too, that is why this
antenna does well for mobile satellite reception. AND it is dual band
for the 2m uplink as well. See the updated plot (side-by-side) on the WEB
page below.

A handheld GPS will give you all the compass reading you need as soon as
you're moving at a fairly slow walking pace. It's only when you're not
going anywhere that an electronic compass is more useful than a simple GPS
with a heading indicator. Therefore I don't see any need for an expensive
gimballing mechanism as long as you're on land.

Although I do own a 4 wheel drive, I mostly stay on 4 wheels, and rarely climb 16.6% grades. The
accuracy of your heading is going to be more accurate with any (moving) hand held GPS. It is only when
you are stopped that an approximate heading would be nice. For this problem the cheapest model would
work fine - so you are off by 20 degres, at least you are not circling blindly at intersections. The PN
unit can also be calibrated for use in a vehicle with a magnetic field. Maybe the Summit does this
too...

Walter

Mark Fellhauer wrote on 7/16/00 9:36 pm:

I'm aware of the PN unit - here's the problem: The Vector 2XG with mechanical gimballing ($100) only allows for a + or - 15 degree tilt. If you think about it, thats not much. Certainly if you consider roads surfaces (bumps, grades) or g-forces encountered while turning or accellerating, the unit is going to be torqued more than 15 degrees while driving - unless you are driving on a perfectly flat, well-paved road. I don't see many roads like that around where I drive. It would be worse on boat. What one needs is a 3 axis electronically gimballed unit. That jumps the price to $700 and up for a PN OEM electronic compass module.

Also the Vectors have no display. For $250 I can get an electronic marine compass from KVH, electronically gimballed - accurate up to + or - 25 degrees (shock stabilized) with selective damping. This unit has a backlit display and NMEA out. It is designed for powerboats, they also make a unit for sailboats which can handle larger tilt angles.

The Precision Navigation units look pretty neat though and I wouldn't mind having one to play with, but I'd rather put the $100 towards a KVH, or better yet, a GPS that integrates an electronic compass.

Mark

At 09:12 PM 7/16/00, Walter Dunckel wrote:

>Thought there might be some interest here. Precision Navigation has an >electronic compass (which can be hooked to a Parallax Basic Stamp to give >NMEA serial output - if you know the format....) for $50.00.

Well, I'll give you an example where an electronic compass AND GPS. We are working on a steerable parachute to facilitate balloon payload recovery here in N. FL. This is NOT Kansas and we'll like to have a little more control over the payload's landing point than near random chance. Too many swamps and areas I'd rather not go searching.

While a GPS will tell you which way an object is moving, it won't tell you which way it is facing, which is important when you attempt to steer something. In some wind conditions a payload which has a speed vector due to its steerable parachute may be moving thru the air mass on say a heading of 090, but really moving 270 degrees. That's because the air mass has a high westerly velocity that is greater than the capsules easterly velocity.

Thus the GPS thinks the payload is moving west, which it is, but the payload is facing east.

We have to know what direction the device is facing in order to combine the vectors to get where we want to go.

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-97185-2000.07.18-10.29.51--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Got the GPS-III+ and 700 up and running FB on Sunday and while monitoring
packets with the TH-D7A noticed below the SSID in the message were several
"questionable characters". The display was as follows:

1: K4YK-3
 ]"5f}

What does this mean?

And further. When I turned everything back on this morning, the 700
displays "OPENING TNC" but nothing more has happened. No packets are being
decoded, displayed, digi'd or transmitted. The rig just sits there opening
the TNC. What changed from Sunday's operation?

(Admittedly these anomolies are most likely attributable to inexperienced
operator error and not spacial disorientation.)

In any event, HELP PLEASE!

John,
  The "questionable characters" appear to be a portion of raw Mic-E data.
 Shouldn't cause a problem.

Not sure why the OPENING TNC message is displayed. You may want to try
pressing the reset button on the front of the D700 main unit. If possible,
save your settings to disk before doing so.

Thats the ALTITUDE of a D700 station... The old D7 does not decode them
so it just displays the altitude in raw format.

Rendered body type: text/plain

I've got the soldering iron heating up, but I decided I had best check with
the panel of experts before wasting a bunch of time.

I'm about to interface my D700, on which I want to continue running laptop
mobile APRS, with my SSTV unit. Looks like all the one way -outbound SSTV
connections are on the mini-din plug on the back of the radio and the DB-9 is
still available for RS-232 connection to the laptop.

I want to run APRS on one side of the radio and voice / SSTV on the other
half. If this doable? Any special settings to enable the mini-din data
connector?

Thanks in advance.

Ken,

They are "modular handset connectors" that radio shack may not carry. I
recently got some at http://www.markelectronics.com/ during a visit to
the store; but then it IS in my backyard. Mark Electronics does mail
order if that is acceptable to you.

See, I told you they could address it in firmware.   I (and several others)
were very critical of the first release of the eMap and Garmin
listened. They addressed just about every critique of the unit that I
had.   I think they should get a big thumbs up for customer support. Heck,
the company I work for doesn't listen as well to its own employees as well
as Garmin appears to listen to its customers.

I have learned a valuable lesson when it comes to RJ style
connectors.   Avoid a company called "WOODS" that packages modular
connectors.   They are pieces of junk. I bought several packages on
closeout and proceeded to make up several phone cables with their
connectors (not testing any of them first) - not one worked
reliably. First I blamed myself, then I blamed my crimper. Then I went to
Graybar and bought a bag of new connectors and those worked perfectly.   I
can't figure out what was wrong with the Woods connectors. They Mic at the
same dimensions as other connectors, the crimper looks like it's smashing
the teeth of the plugs into the wires, but they just plain don't work.

OK, I've solved my phone cable problem. I had to buy a Radio Shack coiled handset to telephone desk set cable to find a four conductor cable that had the smaller / narrower plastic pieces.

It didn't work out of the box, since it was rolled with the wires not going straight thru. So I clipped off one narrow connector and replaced it with a regular sized one (for the radio main unit end that accepts the larger RJ-11 connector) and crimped it on so the lines went straight thru.

Seems nothing is easy in life!

A common fault is the separation fingers that slip between the wires on the jack get too fat, and the wires aren't allowed to fall through and rub against the contacts. Shoddy molding, too much pressure, worn out mold..

 I'm going to take the liberty of forwarding you a PDF file just sent me by
Kenwood that pretty much as pin-outs for all their connectors. File is
called: connector.pdf Probably a pretty handy thing to have. It's all the
same stuff available in the manuals, but all in one place.

That's a great help! By any luck do you have a similar file for Icom? (Of
course, they are NOT the same!)

Thanks

147. [htaprs] 19th Annual ARRL and TAPR Digital Communications Conference

From: Stan Horzepa <stanzepa@mail2.nai.net>
Date: Tue, 18 Jul 2000 21:20:43 +0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-97263-2000.07.18-20.25.50--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Press Release: July 6th, 2000

19th Annual ARRL and TAPR Digital Communications Conference

2000 ARRL and TAPR Digital Communications Conference
September 22-24, 2000
Orlando, Florida

It is that time again! Time to start making your travel plans and thinking
about what to publish for the upcoming 19th Annual ARRL and TAPR Digital
Communications Conference.

The ARRL and TAPR Digital Communications Conference is an international
forum for radio amateurs in digital communications, networking, and related

technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-oriented amateurs of all levels of experience.

The 2000 ARRL and TAPR Digital Communications Conference will be held September 22-24, 2000 in Orlando, Florida. This year's conference location is just minutes away from the Orlando International Airport (MCO).

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes networkers, sysops, software writers, modem designers, and digital satellite communications enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the frequency allocations we now have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

Area Attractions

The Orlando Florida area is famous for its attractions and vacation spots. Disney World, Universal Studios, and Sea World (just to name a few) are within 15 minutes of the hotel. Shuttle service from the hotel will be available for a small fee. Cape Canaveral and Cocoa Beach are a 30 minute drive East of the hotel.

148. [htaprs] Packet POLICE software

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 18 Jul 2000 22:04:39 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-97277-2000.07.18-21.10.19--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We need one of our code-writer-wannabee's to write a PACKET POLICE program that looks for common "errors" and sends out a "alert" message to the person generating such an error. Here is an example.

A person sets UIDIGI in his MOBILE to WIDE for a one-time demo and forgets about it. FOr the next month or year, his station DOUBLES all traffic on the local channel by digipeating every packet heard.

The algorithm here is simple:

If a packet is DIGIPEATED by a D700, then
   1) Compare to other copies of the same packet. If the SAME
      digi field containing the D700* callsign is a WIDE in another
      copy, then that D700 is acting as a WIDE digi.
   2) Send a message to him such as:

      Ur D700 may have UIDIGI set to WIDE. Pse check for QRM

   3) Count these packets over a period of 30 Mins.

   4) Every 30 mins sned a msg liek this:

      We count NNN packets digied by ur D700 in 30 mins. Pse CHECK.

I can think of lots of other packet police ideas... <GRIN>
THis is NOT meant to be punitive, but a "helpful" reminder in case someone makes an unintentional mistake in set up that QRMSs the channel..

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-97294-2000.07.18-22.37.55--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

First I would like to thank Garmin for including the WPL sentence in
their latest software version for the eMap. Now the unit is almost
perfect.

It would be perfect if the next version allowed customization of the
Trip Distance feature on the Map Page. I would like to see a STRAIGHT
LINE DISTANCE option offered.

Thank you Garmin!

Russ Brown, KB6LUD
(Hey, it worked for Keith Sproul)

Rendered body type: text/plain

Bob, and others....

Not that I do not have enough other projects, but I have about 1/2 of this
written anyway for another purpose, in perl. I am prepared to donate the
code I have, or work on it myself if needed....

Good idea... Also something else to look for is WX stations that send
temperature at 4500 degrees...

Message-ID: <LYR845-97353-2000.07.19-05.15.16--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,
as i saw, with the new software V2.51 WPL-Sentences can be downloaded
towards Garmin's eMap.
Does this mean, like with the GPS III+, now it is possible to have
moving waypoint-marks (maybe being send from the TH-D7) visible on
Map-Screen ?

I personally would like to have such a feature also with Germin's
Streetfinder.

>Anyone (including the usual suspects, I will not chase you down
>this year) that will be there and wishes to present should notify
>me within the next week, including the topics you wish to present
>and the amount of time you would like.

So far, with half the week gone, I have gotten requests from only these
people:

The Sproul Brothers
John Hansen
Tom Schaefer
John Blowsky
Darryl Smith

If you are going to be at the DCC and wish to talk at the APRS symposium,
you must let me know in the next few days. Please include the topic and
the length of time you would like.

APRS AUTHORS TAKE NOTE
I am not chasing people down, if I don't hear from you by Sunday I will
presume you do not wish to present. There are simply too many authors now
for me to do this individually...

Everyone else take note
I'd love to see more of you presenting!

Thanks,

Steve K4HG

157. [htaprs] ARRL DCC & Kenwood D-700 APRS Speech Contest

From: Keith Sproul <ksproul@td.rutgers.edu>
Date: Wed, 19 Jul 2000 19:53:30 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: propnet@greeceny.com, htaprs@lists.tapr.org, aprs@qth.net
Message-ID: <LYR845-97471-2000.07.19-18.58.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
======================================================================
====        Kenwood D700 APRS(tm) Speech Message Contest       ====
======================================================================

The Kenwood TM-D700 Radio has the ability to have a speech synthesizer
added to it.  If you add this option, you can make the D700 'SPEAK' or
actually 'SPELL' APRS messages.

When you send a message to a D700 with the VS-3 Speech chip, it will SPELL
the call sign of the station that sent the message.

In addition to this, if you put a percent sign '%' as the FIRST character
of a message, it will SPELL the letters and numbers of the message.

For example, if I send the following  message from WU2Z to WB4APR,

        %ICU2

Bob will hear:

        DOUBLE-YOU YOU TWO ZED  I SEE YOU TOO

We are announcing a contest to see what kind of messages people can come
up with for using this neat feature of the Kenwood TM-D700 radio and the
VS-3.

======================================================================
Rules for the contest:

* There will be three categories:

        The LONGEST message that makes sense.

        The MOST TECHNICAL message.

        The most original or funniest message.

* The winners will be announced at the ARRL Digital Communications
Conference in Orlando, FL, September 2000.

* Each winner will receive a $50 gift certificate from Kenwood Radio.

* APRS Authors and Kenwood employees are not eligible.

* The judges will be the APRS Authors and Kenwood personnel that are
present at the September 2000, ARRL DCC in Orlando, FL.

* All decisions of the judges will be final.

* All entries must be sent by email ksproul@noc.rutgers.edu by September
1st, or delivered in person at the DCC.

* PLEASE put D700 CONTEST as the subject of the email!!!

* You must have a valid Amateur Radio License to enter.
```

* You do NOT need to own a Kenwood D700 or VS-3 to enter.

* You do NOT need to be a registered user of any version of APRS to enter.

* You do NOT need to be present at the ARRL DCC to win.

* In case of a tie, i.e. exact or very similar duplicate message the
earliest received entry will win.

* In case of other ties, the judges opinions will determine the winner.

* All entries can be used by Kenwood and/or the APRS authors for demo
and/or advertising purposes. All entries will be posted on the Web after
the contest, with your call sign to give you credit.

* Entries that imply profanity or inappropriate content will be ignored.

==========

The documentation for the Speech functions of the D700 are at:

        http://aprs.rutgers.edu/D700Voice.html

There is also a copy of it at:

        http://dorm.rutgers.edu/~ksproul/D700Voice.html

(If one is down, try the other, I will keep them both updated)

If you have questions about this contest, or how the Voice option works,
please send email to me at: ksproul@noc.rutgers.edu

As questions come in, I will update the documentation if needed.

You may distribute this announcement to other places, but you must leave
it exactly as is.

It's a chip that fits inside the D700, so I suspect uses other than with
the radio would be limited. Best docs I've seen on it are in the manuals
for the D700. The APRS functions that can use the speach chip are
documented in the "Specialized Communications" manual. Both are available
from http://www.kenwood.net/

Through all of this, I still have not heard my VS-3 saya word other than
menu numbers, frequency and power when you hit the VFO button, etc. Not a
peep when it is supposed to bark out calls. I set the D700 for English as
well as APRS only. Not a word. Maybe I need to sweet-talk the little lady
inside, or drive slower or something...

Sorry if this information has been put out before. I don't remember seeing.

If you want email notifications of pending disasters, this is the site for
you. Might be useful if you have one of the new digital cell phones that get
the short email messages.

Anyway to tie this to APRS.

Maybe this can shed some light on it. I don't have a D700, but I have the
PDF manual for it.

"Note: When using an optional VS-3 unit, you may select "APRS ONLY"
in Menu 1-2-4 (VOICE). Each time you receive a message addressed
to you, the transceiver announces the call sign of the sender. If the
initial
character of the message is %, the transceiver announces the
subsequent characters one by one."

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-97801-2000.07.21-11.06.19--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just spoke to Dave at Kenwood Canada and this week they received the
necessary equipment to upgrade the TH-D7A to the G model. The upgrade is
about CDN$85 plus taxes and shipping.

Dave's number is (905) 670-7211 EXT.367
The shipping address is:
        Kenwood Canada
        ATTN: Service
        6070 Kestrel Road
        Mississauga, Ontario
        L5T 1S8

With the rig, send a letter saying that you want the upgrade done on your
radio, your phone number and address. Someone will call you for payment
over the phone with a credit card.

Daniel

I have downloaded APRSTK (Astars) to take a look at it.
Does it require updated Keps. How is this done?

I did!

> does the voice work at all?

Yes.

Have you tried a different voice module (if
> available)?

Nope. I would have tried this except that the doggone thing works in other
ways, therefore my conclusion is that the module is working.

Have you tried putting your voice module in another
> D700?

Nope, not too many out yet. There are about a dozen of them here in
Raleigh.

Have you tried setting it to always use voice?

Yep, no workie-workie.

Have you
> checked the connector for the chip? (I'll assume you got it in the
> right way, cuz I don't think it fits the wrong way), etc.

Yep, no problem there - also , remeber the voice synth DOES work...
>

With the APRSTK program running, type "I" (for input) and then "K" (for keps). Following screen prompts for what type of file (AMSAT/NASA) and then tell where the keps file is located (if the keps file would be sitting on a floppy in the A drive)---   a:keps.txt for example....the the screen prompt will ask you if you want to update the leo.orb file and you will type "Y"...and your updated....

Rendered body type: text/plain

Hi there,

Trying my thd7 on regular packet I get
cmd:?too long

This message comes just after the tnc starts and the intro message comes.
It repeats all the time, makes it impossible to enter any commands.

Several resets dont make difference.

APRS is working OK

Hooking up with the Kenwood manager doesnt work, only gives errors
communication failure.

Somebody knows what is happening here??

Rendered body type: text/plain

You didn't say what packet or APRS program you are using.
I would check my tnc.ini file(s) to see if they have the CR/LF at the end of
each line.
I would double check any setup textbox to see if any string is longer than
you intended.

Can't suggest anything else right now

Check for a tnc parameter MFILTER...it should be set to OFF, depending on
your tnc. I had exactly the same problem with my AEA DSP-2232 and found it
set to $80...caused the icons from the D7a(g) to not show up as anything but
red dots. 73

Dear Friends,
I am an italian OM and I have a question on my new Kenwood TM-D700E.-
The question in:-
When I set (in packet) the baud rate at 9600 on the display is ever 1200 and not change to new value.-
Were is the error.-
Another question is:- There is a version of APRS software to use it on a portable 386SX under DOS?.-
Thanks in advance.-

175. [htaprs] KPC3+ Cable Help

From: "Herb Gerhardt, KB7UVC" <gerhardt@hctc.com>
Date: Sun, 23 Jul 2000 19:29:00 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-98112-2000.07.23-21.35.49--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am building a new cable for my mobile APRS tracker. This cable is to be
used with my Alinco DR140 radio, my Kantronics KPC3+ TNC and my Garmin III+
GPS. It also has an power connector that will power the radio, TNC and GPS.

The problem I have is that as soon as I connect the Input signal pin from
the GPS to the TNC (Pin 3 of the DB9) the radio goes into continuos
transmit. That is even before the GPS is powered up; it is connected but
OFF. This connection also goes to Pin 4 of the Mic Plug on the DR 140.

I have previously made a similar cable (which was stolen) but this cable did
not have the Data In Pin of the GPS connected to anything. Now since the
TH-D7A is able to upload the received stations to my Garmin III+, I am
trying to see if I can achieve this same feature using my DR140 with a
KPC3+.

Has anyone succeeded in doing this feat? If so, please let me know what I
am doing wrong. I am still continuing to read my manuals and see if this is
even possible or not but figure that maybe someone out there has already
determined how to do this.

Any help would be appreciated.

Thanks,

Herb, KB7UVC

I may be wrong here, but I seem to remember that the second serial port on
the KPC-3+ is data in only.

>the GPS

Just so I get a clear idea: From your wording below I take it that you are
referring to the "data input to your GPS". The major problem with the word
"input" of course is the relative nature of it. I just want to be sure you're
not talking about the NMEA data that the GPS generates that can be connected
to the *TNC* input on pin #2 of the KPC-3+ DB9 connector, the one you need to
set up in SW using GPSPORT. That port has an input only, no output from the
TNC is possible on any pin.

> to the TNC (Pin 3 of the DB9) the radio goes into continuos
>transmit. That is even before the GPS is powered up; it is connected but
>OFF. This connection also goes to Pin 4 of the Mic Plug on the DR 140.

The problem here is that you are connecting a GPS wire to the PTT line. If
the radio's PTT is correctly wired to this pin, then the mere presence of the
GPS on this line seems to be engaging the radio's PTT. RS232 inputs (that of
your GPS in this case) are grounded loads. Apparently the impedance is low
enough to be pulling the radio's PTT close enough to ground to engage the
transmitter.

Try as I might, I can't find a diagram for connecting the Alinco DR140 to the KPC-3+ in Buck K4ABT's web pages. Go here http://www.packetradio.com/0imgs/al605kp3.jpg for the pinouts of the KPC-3+ and the *mostly* similar Alinco modular connector of the Alinco 605. Go here http://www.packetradio.com/trad/a140rj45.gif for the definitive poop on the DR140. The difference between the 140 and the 605 connections is that on the 140 you get the receive audio from the modular connector, not the speaker port. Take a look especially at pin 3 of the KPC's DB9.

>I have previously made a similar cable (which was stolen) but this cable did
>not have the Data In Pin of the GPS connected to anything. Now since the
>TH-D7A is able to upload the received stations to my Garmin III+, I am
>trying to see if I can achieve this same feature using my DR140 with a
>KPC3+.

Instead of using the SW GPS input-only port of the KPC-3+ you could instead use the computer port for a full 2-way RS232 connection.

However you're still doomed in that you don't have anything in the tracker system that's generating any $GPWPL sentences that the GPS uses to accept new waypoint definitions. The KPC-3+ doesn't create them as far as I can tell. The only GPS-specific outputs I've seen described in the KPC-3+ documentation (look at your addendum flyer, not the bound manual) is that DGPS data can be routed to the DB25 via the MYDGPS command (note of course that this requires the presence of heard DGPS packets on the APRS channel). FWIW, GPS input via the DB25 connector requires the use of INTFACE GPS. You might have been reading this list or the main TAPR APRS Sig when we hashed through the command to get out of GPS mode, three control-C's in quick succession followed by patient waiting (don't hit RETURN).

>Has anyone succeeded in doing this feat? If so, please let me know what I
>am doing wrong.

Expecting results from nonexistent firmware functions, I'm afraid. :-(

>I am still continuing to read my manuals and see if this is
>even possible or not but figure that maybe someone out there has already
>determined how to do this.
>
>Any help would be appreciated.

Once you fix the wiring error then you'll get back your full performance simple tracker. Unless you also have a laptop or Palm computer running the appropriate flavor of mapping APRS SW, I don't see anything in your equipment collection besides your D7 that can generate station icons on a map for you.

Rendered body type: text/plain

APRS Satellite wannabees,

   I have slightly misslead myself and you on these lists, when I have touted the 20" vertical whip as giving me great performance on all satelite downlinks when the birds are above 25 degrees or so. Yes, it does, but since I was using a 150 foot run of coax to the office roof, I was using a 0.8 dB NF preamp on the roof to make up for the cable loss. I assumed that a barefoot HT in a mobile with no coax loss would do as well as my test situation...

I could never test this, since my VAN roof is PLASTIC, so I never could get a real test from a mobile. But the few times I tried it with a mag mount in other cars, I was disappointed compared to what I see in the office.

Today, I found the smoking gun. I FORGOT that the D7A is optimized for
the 444 MHz band and not the 430 MHz band! These figures I posted over a
year ago tell the story. The HT is about 3 to 4 dB down at 435 MHZ!

THUS MY USE OF A PREAMP was giving me at least a 3 to 4 dB advantage over
anyone else. ALso, this explains why the few reports I have gotten from a
european using the D7e DID confirm my good results...

The GOOD news is that the D700 is about 2 dB better.   But the serious
mobile Satelite user might still want to consider the few dB advantage of
a good Preamp... This combined with the 20" whip will give the results
that I have been touting...

Sorry. This is all experimental, and so now this is another good data
point in our quest for mobile satellite messaging..

I'm having trouble programming the repeater offset on my D7. The manual
says F, 5 then use up/dn keys to select. I'm trying to get .6 MHz, but
it goes from .56 to .61. Is there any way to enter .6 MHz from the
keyboard? Or get steps other than .05?

> Just out of curiousity, how do you keep from blasting the preamp with RF from
> your HT in the office?

Very carefully. I have the D7 connected to APRStk which automatically
tunes all downlinks set to EL transmit power. But of course, I have
forgotten several times and it has transmitted at 5 watts several times
into the Preamp (through 150 feet of coax (6 dB) so probably less than a
watt has hit the preamp. So far, the preamp has survived just fine...

Another way is to simply place back-to-back diodes across the output of
the preamp and let them short out any transmit energy. But being lazy, I
probably wont get around to that until I smoke this one.

Or place a diplexer at the roof. Only UHF goes to the preamp, so any 2m
transmit energy gets split out to a 2m whip. But if you transmit on UHF,
then you still hit the preamp pretty hard.

My preamp is an ARR GasFet preamp without any special protectiojn..

No good answers here..

Rendered body type: text/plain

I'm wondering if anyone has ever seen a small circular polarized antenna for the 430mhz band? Would the improved performace of a circular antenna should make this work? I don't see any reason that one couldn't be manageable in size. Ideally, it should be small enough to replace the whip. I have a 2m eggbeater antenna on my roof. It's about 4 feet in diameter, and weighs about 10 lbs. If this was scaled down to 440, it would be about 18". It would have to be lightweight and flexible to avoid damaging the radio. The loops would need to be made out of the same kind of rubber coated wire that is used for handheld whips. I suppose that you could mount the antenna somewhere and connect to the D7 with a cable, but this defeats the portability of the radio.

18" is still a little big for a handheld. My experience with circular antennas is limited. I don't know of any way to scale this down further without losing the polarization.

184. [htaprs] D7A trouble

From: "Lee Ciereszko" <n4tcw@yahoo.com>
Date: Tue, 25 Jul 2000 15:54:42 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-98482-2000.07.25-15.16.12--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Set-up:
1. D7A (non G)
2. Palm Pilot w/PalmAPRS 1.05
3. Garmin GPS 35-HVS

Trouble:
        After initialization, radio will transmit once (sending position), but will
then not TX anymore (manually or automatically).

Tried:
1. Full reset
2. Different Palm Pilot
3. Different radio on first Palm Pilot and cable
Everything but radio works.
Conclusion:
        Trouble in radio.

Any ideas?

I am having a problem when I connect to a packet BBS then log off, and then
try to connect to another BBS, I have to turn the TNC function off then on
again before it will let me connect. I am sure it is a config problem that I
don't know about. Any ideas?

Has anyone else had problems with the D700A sending some strange characters
in front of the status comment. I've asked several people if they have seen
my line and said has serveral characters in front of the status comment.

I did a reset on it and I reloaded my settings from one of my backup files.
This did not seem to resolve this issue. Anyone have any thoughts on this?

Well I'm sure that this has been asked before, but here goes anyway.

  I've been reading some of the comparisons of GPS units from such sites
as:
http://www.gpsnuts.com/
http://joe.mehaffey.com/
to name a couple. Particularly I'm interested in what options one unit
has over the other for explicit use in APRS. I am interested in those units
that can display icons that may be received from the Radio system. a
bidirectional information status or display. Are there those GPS units
that can or can any of them display a received icon?

There are GPS that can send and receive via the NEMA protocol. The Garmin
GPSIII and GPSIII+ are some that come to mind. New heard stations will pop
up on the GPS as a new waypoint - named by the last 6 characters of the
station ID. Although these units can display many different icons, the NEMA
protocol (as far as I know) does not contain the information about the
waypoint icon. However, if you change the icons manually, the icons will
remain associated with the waypoint untill that waypoint is deleted.

Hope this helps,

Walter

Don't forget the latest version of the eMap, with the latest firmware, it
also accepts NMEA in and displays them as waypoints.   I tested it
personally and it works.

What happens when you exceed the maximum number of waypoints that the unit
can store? Do you lose previously stored (and possibly important)
waypoints, or does the GPS receiver not actually store them as they are
received by the TNC?

That's a good question! I don't think I've made it very close to the 500
waypoints available. The highest I have hit was 200 to 300 waypoints. I do
not leave mine on all the time, but I do live/work in a heavily APRS
populated area. I don't think you will have much trouble with this, unless
you are on a cross country trip or using APRS in an airplane. (A mobile
station is very different than one connected to the internet where you would
expect to see one or two thousand stations all over the united states ....
and beyond).

You can allways delete waypoints by symbol. The APRS waypoints will be
stored as the default waypoint symbol. You can change the icon of the
waypoints that are important to you. Then you can delete all the default
waypoint icons, without deleting the important stations. I find this usefull
so I can be sure that all the stations are recent, and not old remnants of a
week or so ago. I usually mark digipeaters with a "Tower" Icon (kind of
looks like an antenna) since these will probably be fairly permanent.

For a few examples of some screen shots with some of these symbols see:
http://www.radiohound.com/gps.htm

I'm confused. Are we talking about waypoints on two different pieces of
equipment?

1- The Garmin III+ will take input inTO it of APRS stations and they will
show up on the GARMIN screen as a waypoint. As I understand it, there is a
limit of 500. And I did not know that a GARMIN II could take input of
waypoints, and display them.

2- The APRS program running on a PC or laptop, that shows ICONS, etc.

So, if we are talking about the GPS receiver "storing" waypoints, we are
talking about #1, right?

when it is full it stops adding them and periodically displays an
annoying warning message. You can use Win/Mac APRS to dump them to a
file, but it seems that they only take 256 waypoints, so you have to
dump long before the Garmin is full. There is also a program (available
from the TAPR FTP site) called Waypoint which I think can take the whole
500.

Gentlemen, I have a D700 and have never seen a DX-alert, or
know where to even find one on my D700 menu. I was updating my home
APRS 386PC with new dos code, and came across several messages to
the DX list, stored on my PC. So the messages propogated through the
DIGIs to PGH. Where is this found/activated on D700?

73

Ed N3SDO

P.S. Is "73" used in aprs? Shouldent it be 40.4013N 080.0315W ???

Sorry for the confusion.
I was talking about waypoints and icons with GPS (for #1, not #2).

Garmins GPSII+, GPSIII, III+, E-map (and possibly more models) are capable
of sending and receiving NEMA data. This way you will see stations pop up on
your GPS screen as you receive them.

The GPSIII, III+, E-map (and possibly more models) allow you to assign icons
to these waypoints. A screen shot of a GPS which shows a few of these GPS
icons (and base map) is at:

http://www.radiohound.com/gps.htm

Rendered body type: text/plain

I currently power my D7 while mobile with a home made cigarette lighter
power cable (voltage controlled & fused) with a non-metric jack that sort of
fits. But, it's a little long and doesn't seem to stay all the way in quite
right. I frequently have to push it in a little more to ensure a good power
feed.

I can't seem to find the size of the D7's DC power in jack listed in the
manual anyplace. Does anyone know the proper inner/outer diameter's and
length? I've also had trouble finding any right angle type jacks which are
better suited for my intended application...anyone know a source?

Cheers!

SImply press and hold the F key for one second. Then you get a menu with
two buttons. The TNC button is on the left and the DX LIST button is on
the right. Press it, and that is where it displays the Satllite Schedules
on your D700 if they have been transmitted recently.

The DX list is erased everytime you power up the radio or whenever you
change your PM's, so if it is blank, you can wait for 10 miunutes for the
next one to be transimttted or you can send a message to QDOS and in the
message enter "sats" and the local APRSdata server in your area will
respond with a new SATELLITE SCHEDULE...

Bob

On mine they are there somtimes and not sometimes. I dont know what or
why or how to make them apear.
What is the proper setting to make ham calls appear on the GPS III+.

Hi There,

Does anybody know if the d7e version 2 has the same possibilities
as the G USA Type.
I mean 9600 APRS and all other updates...

My old d7 does not work with Randmcnally gps nor with the gps35 because it
has 4 decimals behind the comma
in their gps sentences.

Is this fixed in the new version 2.0

Any help and info appreciated...

Kenwood europe has the pc prg for the several types now on their
website....do they give support ôn this??
Until now Kenwood Europe denied support for these prg's

> On mine they are there somtimes and not sometimes. I dont know what or
> why or how to make them apear.
> What is the proper setting to make ham calls appear on the GPS III+.

The GPS will accept NMEA data anytime you set the interface to NMEA. It will default to 4800 baud.

The TH-D7 (non G model) will send NMEA waypoints to the GPS anytime that the APRS menu item "GPS UNIT NMEA" is selected. (Any waypoints that are within your position limit that is).

The TH-D7A(G) will send NMEA waypoints any time that the APRS menu item "Waypoint 6digits NMEA" and "GPS UNIT NMEA" is selected. The Waypoint setting lets you chose how many characters to allow in the ID of the waypoint. The Garmin GPSIII+ allows 6.

If the above is set correctly, your GPS is working, and your TH-D7 is getting position info from the GPS, then maybe you have a bad wire going back to the GPS. If it is intermittent and you have not changed any settings between it being intermittent, then it probably is a wire problem.

Rendered body type: text/plain

FWIW, I am not getting very good service out of Kenwood Service Center - West on the conversion of my D7A. I sent it in on 07/11/00 via 2nd day USPS and started to get concerned when I had not hear anything. Called them on Monday. 07/24/00, to make sure they even had it. They confirmed they did. They also indicated they were just about to work on it. After not seeing it in the mail by today, Friday 07/28/00, I was once again concerned it was lost. After all, I did sent in $12.00 above the $60.00 for shipping it back to me. My USPS 2nd day was less than $4.00! I called them again today, 07/28/00, and they confirmed they had it and would work on it Monday and ship it out Monday, 07/31/00. Hopefully I'll get it back by 08/02/00. If I do that will make over three weeks door to door. I almost sent it to Kenwood Service Center - East. Now I wish I had. They surely couldn't be any slower.

In terms of APRS functionality, does the mobile D700 offer more than the D-7A? Would I be better of getting the D-700 if one of the main uses was the APRS aspect of the radio. What can the D-700 do that the D-7A cannot?Also, are any other vendors planing to release radio with built in APRS functionality?

Thanks

George

Kenwood East was right on target for me !

Great job Kenwood !

Somewhere here on the list I posted a message earlier this month
when I sent my HT to the Kenwood Service Center East and how
long it would take to get it back after talking with them on the phone.
It looks like they were very informative and accurate, because they
hit my anticipated return date right on target.

My unit arrived today via UPS and I expected it to arrive anytime
after 27-JUL-00. It looks like Kenwood East did an outstanding job in
providing a very accurate backlog timeline when I called them before
sending the unit.

I must admit, Kenwood East did a great job in letting me know the
timeline on their backlog prior to sending my unit. They also sent an
email to acknowledge receiving the unit as well as when they shipped
the unit back to me.

I am very impressed with the service and accuracy on hitting the return
date. There are not many companies that can live up to this standard.

I am not one to give praise to any organization unless they have met or
exceeded my expectation. In this case, my expectation was met based
on their information. I just wish I could find that email I sent earlier
this
month that explained the entire process when I shipped my unit to
Kenwood East. At least it would substantiate my claim on what I

expected.

Please do not get me wrong. I am not defending Kenwood, but when I
sent my D7A I called ahead of time to check their backlog. The nice
women on the phone stopped what she was doing and checked with
the service bay. When she returned, she told me they were working on
a radio that was received about 10 working days prior to that date. So,
with that information I added 3-4 days for shipping and 3-4 days on the
return shipment with a few days of fudge factor to arrive at my expectation.
Some radio's take longer to fix than others and this can be very difficult
to predict and could affect any timeline.

Sometimes we have to reset our expectation to be realistic. Again,
I am not being defensive, but I was being realistic in my expectation
based on the excellent information Kenwood East gave me ahead
of time. In your case, if you sent your radio on 11-JUL I would not
expect to receive it until 04-AUG or shortly thereafter. How did I arrive
at this number? Well, I was being realistic knowing how the real world
operates. Even if you sent it 2 day priority, it probably did not get
checked into the backlog until 14-JUL at some point in the day. With
that in mind and the idea that they probably have a 10 day (that is
working days based on a 5 day work week) backlog much like
Kenwood East, that would put the radio on the bench around 31-JUL
depending on how long it takes to fix other radios ahead of yours. If it
was programmed on the day it hit the bench, it may take another day
to get it shipped out the door if things are going well for everybody.
Then if you give it 3-4 days for shipping I would expect the earliest to
see it would be 04-AUG or shortly thereafter. This does not even
account for somebody getting sick or taking vacation.

I too hated to part with my D7A :-(

I do not work for Kenwood nor am I defending them, but I wanted to
clarify that we must be more realistic in our expectations before
voicing a negative comment without all the facts.

Tim - N8DEU
Huntsville, Alabama

My flame retardant suit has been pulled from the closet and I stand
by to take the heat however shallow it may be.... ;-)

Rendered body type: text/plain

Well, the D700 does do more than the D7A. However, the July-released
TH-D7A(G) brings the handheld pretty much up to par with the D700 as far as
capability (9600 baud APRS, split VHF/UHF operation, advanced messaging, go
see the comparison PDF for more examples).. However, the D700 does have a
larger display and can show what the D7A & G take multiple pages (scrolling)
to show you (insofar as different info about a station, status, relative
location/gridsquare, lat/lon, and power-height-gain or WX data)

Bear in mind also that the D700 is a mobile rig and puts out a heckuva lot
more power than the D7A.

However, I decided I wanted to do all of this in the palm of my hand (or the
belt holding my jeans up). I love the D7G. But they're both awesome radios.

Other Vendors: Alinco has a 2m mobile radio pending "type-accepted"
certification from the FCC that has a built-in GPS option (which the
Kenwoods don't, but that doesn't matter to me) and does dumb tracker
operation. I don't think it will have near the interactive functionality
that the Kenwoods do. It will, however have a serial port so you can hook it
to a PC.

Gosh, did I miss anything?

Mike

Rendered body type: text/plain

I have experienced similar results also. I use my d7 with WinAPRS to hit to
my digi 3 miles away. I have to run high power to assure a heard packet
with the stock antenna. Switch to a ICOM dual band antenna and I can hit
the same digi on EL power at the exact location. I normally try to use a 1/4
wave two meter when using for long periods to save the battery and assure a

more decent signal.

I think Kenwood really needs to (at least) respond to all the reports of
degraded output with the stock antenna. If they have proof to the contrary
PLEASE let us know. Maybe we have damaged our antenna someway. Maybe the
tip is sensitive to damage via excessive handling???

I do know that I found a lot of metal filings in the SMA connector right
after I purchased it. Another post here on the SIG warned me and others
about the possiblity of shorting the final.

Well now you have MY two cents worth.

Other than that ..... I LOVE MY d7A (not a G yet)

Lloyd KD4HTW

Subject: [htaprs] TH-D7A(G) 2M TX Problem
Date: Fri, 28 Jul 2000 16:48:00 -0700

I recently got a TH-D7A(G) to try my hand at APRS. Not certain if this
is entirely on topic; however, I am having a problem with the rig's
radiated RF (not enough), which is curtailing my ability to get on the
mode.

It seems that with my TH-D7A(G) the 2M TX automatic protection circuitry
is extremely sensitive to SWR. I first ran into the problem when I could
not key up local repeaters in high power (theoretically 5W with the
stock PB-39), where I could with another HT in its low power setting
(0.2W). (I have also been unsuccessful in getting any acknowledgements
to my APRS messages, though that might be due to the fact that I'm brand
new to the mode.) Into a dummy load, the TH-D7 produces power at H, L,
and EL
pretty much on spec -- 5W, 0.8W, 0.1W. Swapping the KW antenna to the
other HT I could still key up the repeaters at 0.2W; swapping the other
HT's antenna to the TH-D7 I could barely bring up the repeaters at high
power (5W).

This first led me to consider how the antennas are cut. The TH-D7
antenna hears NOAA (162.55MHz) and train freqs great. With the other
HT's antenna, the same 160MHz signals were much lower. So it would seem
the TH-D7 antenna is cut a little short.

The next thing I tried were some comparisons using a field strength
meter. This is where things came to light. Using the TH-D7 antenna on
the TH-D7 at L (0.8W nominal), the signal strength was 10dB lower than
the same antenna on the other HT at its low power (0.2W nominal). Trying
other antennas that I know are less efficient on the TH-D7 on L (0.8W),
I got readings as much as 18dB less.

So with on-spec power output with a 50 ohm dummy load compared to really
low output using duck antennas, I conclude that the automatic power
circuitry much be very sensitive to SWR. (The 440 side seems to have no
problem folding back on the power -- I could easily key up repeaters on
the EL power setting.) This is to me a problem as any duck is going to
be less than efficient. Most other HT's seem to be designed to tolerate
the inefficiency of ducks.

Has anyone experienced this before, or did I just get a lemon?

I have to vote the other way on this. While the stock antenna on my D7 (originally an "A", the mod to "G" made by Kenwood in June) leaves much to be desired it is no worse than any other rubber duck/dummy load. I routinely run EL (extra low power) from my wife's house (we just got married 8 months ago and will be bouncing between two homes for another 6-8 months or so) and hit my digi at my house 6.8 miles away crow flies distance according to the D7 computation. From my home, which is at 1500 feet I work voice digis in the Burlington VT area that are 17-20 miles away. I can key most of them on EL and work them on L. I also have a Comet SMA-24 antenna an that works considerably better but is damnably inconvenient to carry a round due to its length. I keep it on the dash of my Blazer for when I need it.

216. [htaprs] THD7 Antenna

From: "David Zobel" <dzobel1@rochester.rr.com>
Date: Sat, 29 Jul 2000 10:35:11 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-99149-2000.07.29-09.42.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The THD7 has some great features but my first concern when I got mine a year ago was that there had to be something wrong with either the antenna or the radio. I first had the antenna exchanged by Kenwood. When that didn't work, and the report was that there was nothing wrong with my antenna, I had the radio looked at by Kenwood East Service. Although it came back with a clean bill of health and that there were no problems found, I think that they must have upgraded the software because it acted differently. However, the BASIC functions of the radio leave much to be desired. Poor receive and very poor transmit range. Kenwood telephone support even suggested that I should not be using the Yaesu SMA to BNC adaptor and that they did not supply one. Their concern was the pin of the adaptor may be expanding the connector on the radio. So, what I initially got from Kenwood was that I must be doing something wrong by even trying anything other than the stock antenna.

I have a Comet SMA503 which is better. I've also tried the Yaesu antenna from the VX5R which is much better. So, I'm glad others have confirmed my original assessment of the radio that the antenna design is poor at best. I would hope that Kenwood in the interest of good customer relations will look into the problem and correct the situation. Its great to have a radio with as many features as the THD7 has but without the basic functionality of acceptable receive and transmit, all of these features are useless.

I expressed this concern to Kenwood directly. I hope that the reason I didn't get a response was that they are overwhelmed with email expressing the same concern. Once the marketing folks get wind of the problem, the technical folks will be given proper direction.

Rendered body type: text/plain

A quick key word search of the sig archive on www.tapr.org
would have found many posts about the stock antenna and several solutions.

Don't over look this excellent resource.

My newly upgraded D7G is not showing on on WinAPRS. WinAPRS is showing
others stations, findu.com is showing the location of the D7G. I don't
think I have set any prarameters to an odd setting. Any suggestions?

I too am encoutering a similar situation. D7 shows up on findu.com but
WinAPRS V 2.4.6 does not show my D7. I have not made any strange
configuration changes to either the D7 or the WinAPRS.

I hd this problem with 2.4.6 and our D700s. If you zoom out far enough, I
think you'll see your radio shown off the west coast of Africa, and it
should be in the station list. I don't know what the problem is, but
reverting to an earlier version of WinAORS fixed it (2.2.8)

de K9FI:
David, I assume that you might have seen my earlier post on the relative
merits of replacing the Kenwood OEM-antenna with the Yaesu VX5R antenna

(sans the 6m topload) --- hence, your (additional) confirmation that that
Yaesu antenna is indeed a much better performer when used on the TH-D7
radio.

<snip>

> I expressed this concern to Kenwood directly. I hope that the reason I =

<snip>

de K9FI:
I sent a detailed email directly to Kenwood as well, only to receive
NOTHING in reply. Well, if I were in their (Kenwood's) position, I suppose
that I would have a jaundiced impression, what with a (small) part of the
customer-base using a competitors antenna to solve (in the customers mind)
a problem that the radio manufacturer apparently will not address.
(harumphf!!)

Just as a matter of course, those of the group who own an MFJ-259B...try
this test on your ORIGINAL TH-D7A antenna ---- JUST FOR GIGGLES!

~:?)

1. Assemble an PL-259 -to- SMA(female) conversion adaptorizer, and screw it
into   the top of the MFJ-259B.
2. Screw the Kenwood OEM-antenna (from the D7) into the SMA-jack.
3. Turn the '259B' on, and adjust the frequency until you obtain the lowest
SWR   reading v. a 50 ohm impedance reading.
4. NOTE that the 'frequency' reading will be 160 MHz. +/-
5. NOW...if you have other antennas to 'test' (the VX5R antenna especially)
do   the same.
5a.If you have a sensitive field-strength meter, check the relative
readings as   well
6. Draw your own conclusion...

There have been comments that all rubber antennas are in the P.O.S.
category anyway --- PERHAPS, but some P.O.S. antennas DO WORK BETTER than
others.

Shorty for WB4APR ---- Bob...since you have more specific access to the
ears @ Kenwood, does this discussion merit your advocacy and
intervention???
"We" all love 'ya man!! --- without your APRS-stuff, who knows --- we all
still might be handling traffic on the CW nets!!

~:?)

vy 73!!
Jim, K9FI

Hi,

I had a similar problem and noticed that WinAPRS appeared to be incorrectly
ploting the longitude but if you upgrade to version 2.4.7 this should fix
that problem. Another thing to check would be to make sure that your station
is appearing in the "Stations Heard" list of WinAPRS. If so and you are
reporting a latitude and longitude you should be somewhere on the map.

Good luck....

Chuck

I have seen similar problems with other radios also. I don't think it is a WinAPRS program problem. I run WinAPRS and presently run Version 2.4.7.

My conclusion is that at times your lat/long gets corrupted by collisions of the packets. Just because the band is clear where you transmit from does not mean it won't suffer a collision problem on the mountain top WIDE digi. However if you transmit from your HT or Mobile APRS Tracker next to your home station, it should show up on your home station screen (at least the majority of the time).

I really like the findu.com site, because it shows you what happens by collisions. Sometimes your data string is just altered slightly and not killed entirely. Our Mason County EOC showed up in Germany last Friday on findu site but was still in the correct position on my computer. (Packet received by my computer was OK, packet received by findu site had lost the degree number on one of the parameters and the rest of the info was OK).

Check the messages for some of the stations and you will also note that some of the characters may have been corrupted by collisions. This problem will become more of a problem as APRS keeps growing. That is one of the reasons you should follow the recommendations of your local APRS Network Group for your area since they are trying to come up with recommended settings to limit these sort of problems. Remember the packets on APRS are NOT verified packets, you only control what you send out, not what the other stations receive.

To the NW APRS Group, if you do not subscribe to this TAPR list, you should. It has lots of great info on not just the APRS radio's but also on APRS in general.

Herb,
  It is highly unlikely that a collision will cause corruption of a packet.
A properly configured TNC should reject any packet containing errors.

The likely source of location corruption is IGATE applications that
incorrectly convert the raw Mic-E (D7, D700 etc) and supply
defective data to the Internet feed. You may not observe this
problem if you are not connected to one of the APRS servers.

A single raw Mic-E location packet can result in up to 5 different
converted packets appearing on the feed. The converted locations
and timestamps can differ greatly.

The following packets appeared on the aprs.net:23 on
07/30/2000 during a 2 minute period. 2 raw Mic-E
Packets generated a total of 8 converted packets.
This is an average of 4 converted packets per raw Mic-E
packet..

Raw packet #1 conversions.
K4HG-8>APK101,KD4BBM-6*,WIDE,WIDE:@301708z2450.18N/08046.01Wk283/048/Mic-E/M
1/Enroute>
K4HG-8>APD213a,KD4BBM-6*,WIDE,WIDE/V:@301706z2450.19N/08046.02Wk283/048/E>ds
y/M1/Enroute...]"4-}
K4HG-8>APK101,KD4BBM-6,KG5QD-3*,WIDE:@301702z2450.18N/08046.01Wk283/048/Mic-
E/M1/Enroute>

Raw packet #2 conversions.
K4HG-8>APK101,KD4BBM-6*,WIDE,WIDE:@301710z2450.31N/08047.70Wk248/048/Mic-E/M
1/Enroute>
K4HG-8>APD213a,KD4BBM-6*,WIDE,WIDE/V:@301708z2450.32N/08047.71Wk248/048/E>ds
y/M1/Enroute...]"4(}
K4HG-8>APK101,KD4BBM-6,KG5QD-3*,WIDE:@301704z2450.31N/08047.70Wk248/048/Mic-
E/M1/Enroute>
K4HG-8>APK101,KD4BBM-6,N4FSU-1,KS4NS-3*:@301704z2450.31N/08047.70Wk248/048/M
ic-E/M1/Enroute>
}K4HG-8>APK101,TCPIP*,N2LBT-1*:@301704z2450.31N/08047.70Wk248/048/Mic-E/M1/E
nroute>

These conversions can cause a mobile track to contain
spurious locations. This can cause a d7 track to appear to have
numerous small zigs and zags.

It appears that at least one version of an APRS application
cannot successful convert Mic-E packets that contain
postion ambiguity. This might explain why a station
from the west coast might appear in Germany.

These problems are not caused by the D7 but are
largely due to a lack of standards regarding the decoding
and conversion of Mic-E packets.

226. [htaprs] Missing VB6 OCX for Tracking Program

From: "Karl G6ODT" <g6odt@btinternet.com>
Date: Mon, 31 Jul 2000 00:10:59 +0100
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-99491-2000.07.30-18.16.56--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All,

For those of you who didn't have the missing VB6 files already on
your computers and got errors while trying to run the Satcontrol
program here is the message that I've sent to the 3 stations who

let me know of the problem. I'm sure there must have been more !

I found 3 files that are needed for the Sattrack control and the program to
work correctly.

You'll find them at :-

http://members.tripod.com/~g6odt/vb6ocx.zip

Tripod will almost certainly put up a html page when you click on the link, this
doesn't mean it's a bad link but if you look at the bottom of the page there
will
be another link to click on to collect the file.

Once downloaded unzip all files into the windows\system\ folder and then
manually
register them using   REGSVR32.

eg from the start menu select RUN and type regsvr32 mscomct2.ocx
repeat this for mscomctl.ocx and then sattrack.ocx

Everything should then work ok. it will even run on a 486 ! It runs here on a
486 dx2 66
with 16Mb under Win95.

Thanks for the heads up on 2.4.7, Chuck. When I noticed the problem and
looked at TAPR for an upgrade, the latest version was 2.4.6. Actually, as
I was writing this, I looked and the latest is still 2.4.6. Where'd you
get 2.4.7?

Oops, never mind. I checked Rutgers (the url listed in WinAprs Help About
and found it. For others, it's at:

ftp://aprs.rutgers.edu/pub/hamradio/APRS/WinAPRS/

Chris

I have aprs/ce on a casseopeia, and want to connect it to my DTR7 -but
am having probs getting the program to behave. Anyone been there and
bought the T-shirt?

Rendered body type: text/plain

Hi Folks,

  Is there any documentation published that discusses the protocol required
to connect to APRS servers via TCP/IP? Also, does anyone know of Java code
that exists for any APRS applications? I am learning JAVA at the moment
and any related examples will help the effort.

  I want to create an application that logs stations in a database, allows
for queries to this database, gateways email, tracks stations and sends
reports via email, etc........

    Early last year I started working on a similar application in Perl.
After two months of work -> HARD DRIVE CRASH (no backups). Oh well, live
and learn. I work in MIS and preach the virtues of backups at work all
day. Call me doofus!

          Thanks

             George

I understand that there are seperate PalmPC and PocketPC versions. Are you using the correct version? Just a thought.... My new Casio E-115 is on it's way from Casio. I have not tried APRS/CE on my original E-100 so I am itching to get my new unit! Any feedback from other APRS/CE users? How functional is it in terms of a feature set?

George

Well, the program's not going to behave at all - it has expired!

First, my apologies to all - the program expired. I'm going to attempt a build tonight - I'll set it to expire at the end of October. This is what happens when you have two other projects going...

I have been trying to get a native PocketPC version working. All is complete except I can't get my menu to show up - at all. (I'm about to pull my hair out - I've tried everything to get it to work...) As soon as I get it working, I'll create an install that includes the native PocketPC builds. (That way, Compaq iPaq owners can get in on the fun!)

Again, my apologies for the inconvenience, and I'll notify everyone when the next beta is available...

-Rob

Ive had my E115 for must be nearly two months :) We must exchange notes in due course..

For other list members..

Its a nice program, but I can only get it to lists the station calls, it will not storetheir locations (hence doesnt plot them). Im using aprs/ce build691 ..ha! I just launched it to help me write this email and it EXPIRED yesterday.... ah well, have to wait for the next beta!

The display of DOSAPRS maps work well (I havent tried any other) and they suit the colour screen well (the autoroute street map program uses Dosaprs looking maps to do its stuff and is also a 'killer application' IMO.

Im wondering if aprs/ce needs to be registered to work or perhaps it isnt picking up UIVIEW positional packets (which dominate in the UK)

I asked Curt to post his reply so we can all learn from it. Since Curt is not a member of this list, I am posting his reply.

Thanks to all that responded to my comments. Yes, I had several comments that convinced me that my conclusion was in error. That is good, since we are all still on the learning curve.

I have had lots of correspondence with Curt since he got into APRS last year and I have great respect for his technical knowledge and desires. Curt is a great asset to our hobby. He is one of the heavy hitters and is also working on integrating APRS into his county's SAR activities.

Curt, you might want to join this list. There is lots of good technical
information exchanged on this list on not just the Kenwood APRS radios but
also on APRS in general.

Thanks again to all that responded,

Herb, KB7UVC

Rendered body type: text/plain

KH6JJD has just departed Annapolis with a D7 on board a Naval Academy
Sailboat. He will be on the 144.39 Terrestrial network when in range, and
will report his positions via SUNSAT and UOSAT5 when off shore.

ALthough a HAM for dozens of years, he only got a THD7 last night and a
CRASH course in APRS, Satellites, and all the rest in one hour during
lunch hour. SO it will be amazing if it works... But look for him all
the same...

Also, if you see any POSITS from him or messages via the satellites,
please send them to me wb4apr@amsat.org.

THanks
de WB4APR, Bob

You didn't mention where he's headed..

....and as of 5:47pm EDT findu.com says

Position of KH6JJD (Theodore Rogers)
Report received 2 hours 37 minutes 2 seconds ago
(naval academy posit shown)

Did he take the D7 instruction manual along? :-)

Hey everyone, we coiuld use the next two weeks as a magnet to get everyone
back on the air on the birds. After a few months of experimenting, I have
kind of slacked off as well as many of the other testers. How about
we try to keep the birds busy for the next two weeks?

I doubt the sailboat will be up for many passes, but when they do, it
would be nice if they saw something. And they are NOT running with

messages wildcarded, so either send them a message, or send us all a
bulletin...

Remember, we have "SUNSAT" on 145.825 UP 9600 baud and 436.250 +/- 9 Khz
down. and "UOSAT5" on 145.975 up and 435.120 +/- 9 KHz down.

See ya.

P.S. for every packet from KH6JJD, the academy Sail Boat, please tell me
about it.

10. [htaprs] GPS - which one to choose?

From: "Dr. Werner Furlan" <furlan@gmx.net>
Date: Wed, 2 Aug 2000 12:06:03 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-99985-2000.08.02-05.11.15--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

hello all,

I am new on the list, so please forgive me if my question has been
discussed before.
I want to buy a new GPS to connect it to the THD7. My choice is either
the Garmin Emap or the GPS III plus.
I have no store in my region to look at the two units, especially the
GPS 3+ I have never seen. So I ask you, which one you would recommend
and how are the experiences.
I would use the unit mainly in my car.
my questions are:
Do I need a external antenna for good performance in the car?
What kind of adapter do I need to connect the Emap to an antenna with
BNC connector (is it SMA?)
The display in the emap seems to be better, is it also better readable
or just bigger than in the GPS-3 plus?
Is the 1.5 Meg adititional RAM in the GPS 3 enough, or is the memory
card of 8MB a big advantage in the emap?
Does the Emap display the Stations received from the Kenwood handy on
its map like the GPS3+ does?

many questions, I hope to find a friendly reader who knows both units
and can help me to decide.

txs,

73!
Werner

<< Do I need a external antenna for good performance in the car? >>

HI Werner, my Magellan 320 works fine just sitting on the dash board of my
car. It also worked fine on a ferry boat ride I took up the "inside passage,"
provided the unit was next to a window. Dashboard operation means it is
sitting there in the sun, so I protect/hide the unit if I leave the care for
a while.

There is list APRS - PLUS where the Garmin III seems to be very popular. I
saw one and was impressed by its features. I thought it would be nice to have
a remote antenna for an application deep inside an RV or boat.

Mobile APRS is great fun but quite "wire" intensive. (1.) Remote antenna for
D7A is nice, (2.) 12 V to the D7A boosts its power output, (3.) GPS
connection to D7A and GPS connection to 12 V is nice because GPS's eat
batteries (4.) I also connect my D7A to the car radio via one of those Radio
Shack "cassette" adapters. This is nice because you can monitor (on the car
radio) the local voice repeaters while your APRS is functioning on the other
channel. Now adding a remote GPS antenna would be another cable to the setup.
  Drive very carefully if your application is mobile.   ;-) At one time I
even tried to add a headset microphone to this mess.

APRS-Plus uses Street Atlas USA with computers or Palms to track multiple
positions to the street level.

 <A HREF="http://www.qsl.net/ve5dgd/">Web pages of VE5DGD, David Dunster in
Regina Saskatchewan Canada</A>

 I purchased the Magellan because it was cheaper and had a hugh data base of
marine waypoints. The so called Data Send CD leaves a lot to be desired. At
some point I may upgrade to a Garmin so your research of the emap with be of
interest to me.

By the way I have seen Garmins for sale in many sports stores and even KMart.
I saved some money and tax by Internet purchase but the Magellan arrived DOA
(sent it back). If you purchase from a store verify operation before you
leave the parking lot, though I don't think there is a high frequency of
these failures.

I currently use the eMap with my THD7(G) and am pleased with the
performance. The upgrade to the eMap software (2.5 I believe) is supposed
to support NEMA in and out so waypoints should be visible. I also use this

combination with a Palm IIIx and have had no problems. I haven't tried the
 upgraded eMap yet because my THD7 was being upgraded. By the way (for
those interested) the radio was mailed on 7/6 and back at my doorstep on
7/28 from the East Coast facility.

I would recommend the eMap although I don't have any experience with the
GPS III. The 8 meg card is optional and I don't use it. You may want it
though for your application. I would recommend the external antenna for
use inside the car. Garmin has a small connector on the back of the eMap
and I haven't seen an adapter for it to go to BNC. The antenna -I believe
- is an active antenna which requires power from the eMap (?).

Greetings to all of you from Athens,

i have a TH-D7E and just before a week i

got a Garmin GPS 12. I'm planning now to

buy a palmtop, and with the money i have to

spend i can get the Compaq C-1520 or the

Palm IIIe.

I want to start with APRS and i don't know

much about it. Which one is better for APRS ?

Is it easy to find software ? especially is there

any chance to find somewhere maps of Athens ?

Any help ore comment will be much appreciated.

What is the digi path to use on the sat's? Will APRSAT work on all? I
could not find a list of this anywhere.

        Also look for N3OBQ-7 this weekend on the Chesapeake bay. Racing the
Governor's Cup Race to St. Mary's city. Start is Friday evening off of
Annapolis, all night to the finish. Boat is a J/42 named Falcon.

SUNSAT and UOSAT5. APRSAT should work on SO35 too, but it seems to come
and go depending on the software load..

Rendered body type: text/plain

hello all,

I got very informative comments from Norman, Russ, Scott, Keith, Paul
and Ron, where they explained how they made their choice and why they
are all content with the unit they have. So both units are very nice.
The decision is not so easy but I am more informed than before.
my choice is going towards the GPS III plus because:

the unit has a better battery life
it seems to be easier to fix in a car because horizontal position is
possible
it has standard BNC plug for external antenna and if necessary I can
use the antenna of the unit and with some meters of RG58 I have it
outside the Van / boat / house
it is easier to connect to a external voltage supply (12 V without
voltage regulation possible)
the map RAM of 1.5 MB is enough for my purpose
I use it mainly in the car, so size and weight is not so important
I live in a mountainous region with many woods so maybe a external
antenna will be better than built in.

thank you all who have answered, it is very much appreciated.

73!

Werner ! you will have fun with your D7A and the GPS. I am fascinated by both
technologies (but no expert). One of the things I like to do is document
photograph locations by making a waypoint in the GPS. Later these positions
can be downloaded to Street Atlas.

You might. It depends on the vehicle, especially because of variations in the window glass (tinted or clear). I have seen cases of older vehicles with clear glass in which the GPS receiver can be located anywhere and still work, even on the floor between the front seats. Luckily the approximately 1500 MHz signals do a good job of bouncing around the interior of most vehicles. I have also seen cases of newer vehicles with heavy window tinting in which the reception is slightly poor even with the GPS sitting far forward on the dashboard. The slope of the windshield is a factor - the antenna needs a clear view of most of the sky, which is not easy if the windshield is nearly vertical.

An external antenna can provide some important benefits:

1) You can place it on the vehicle roof for a completely unobstructed view of the sky. This will give you better position fixes on average because more satellites are visible at any one time, and also because you don't have to worry about the receiver taking a long time to lock onto the signal from a satellite that was just "revealed" when your vehicle changed directions. Not everybody wants to leave an antenna exposed to the weather or vandals though.

2) It can allow you to hold the GPS receiver close for viewing while still receiving good signals with the antenna placed well forward on the dashboard.

3) Many of the remote antennas also include low noise amplifiers, so your GPS signal reception will probably improve. This is important if you drive in places where there is heavy tree cover. Also see my point #1 above.

So at the very least you should select a GPS that will accept an external antenna. You don't have to buy the antenna unless you find out that the signal quality isn't sufficient without it.

***

Another person responded about the physical mess that can result from all the wires going between all the different pieces of equipment. At least the THD7 combines the radio and the TNC. That eliminates one cable, but if you find that 5 watts isn't enough transmit power, you might end up adding an amplifier so there's another cable. I think that you are getting the idea that doing the installation well takes a lot of work.

In my case I used to use a handheld GPS with a remote antenna in my tracker. The mess of wires was intolerable, especially to my passengers. My solution was to install the cables permanently in hidden places, and to buy a second GPS to be permanently installed in the vehicle. It's a Garmin 35 which has no display or keyboard, no user interface of any kind. There are other manufacturers to choose from as well: Rockwell makes a GPS receiver that isn't even inside a case, Pharos makes a very small receiver with a case. You can get specific recommendations about those from other people who read this list.

I wouldn't recommend a no-interface GPS if it's your first GPS purchase though - you will probably want to be able to make use of it handheld from time to time. It's a large investment, so that makes a lot of sense.

If you really will use the GPS primarily in the car, then the Garmin III+ is much easier than the EMap to install well. It sits low on the dashboard and there is a nice quick-release dashboard mount available.

73,
Tony KD7TA

For those of you with a similar dislike of the TH-D7 antenna connector and antenna to my own, I have found an SMA to BNC adapter that can be left on the 'D7. It is working out well for me and I thought I'd pass it along. I have a writeup on my web page: http://www.qsl.net/wa3hrl. No, I'm not selling it, nor do I get a commision, I'm just passing it along for those of you who may find it as useful as I do.

23. [htaprs] Update from Kenwood UK on THD-700S, THD-7E etc

From: "Simon J Hopkins" <aprs@skewsby.demon.co.uk>
Date: Fri, 4 Aug 2000 10:57:30 +0100
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-100527-2000.08.04-05.03.18--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The following is the text of an email sent to me by David Wilkins of Kenwood UK:

Firstly, re the sub-versions of the D700E. In Japan they have a far more developed Novice system and (I've head rumoured) have a million novices - so many in fact that they aren't in the callbooks! As these novices use low power, there are in turn many low-powered versions of the different radios, so for example in Japan we sell the TS-570 in 10 Watt, 50 Watt and 100 Watt versions. In the West, a 10 watt TS-570 wouldn't be much use so we don't import it!

In Europe, we have the 50 Watt D700 as the TM-D700E. In Japan this is known as the D700S with built-in TNC. There is also a 20 Watt low power version with TNC called the D700 (no added suffix letter). The V708S is the non-TNC high-power version - the V708 is the low-power non-TNC version.

A V708S is really similar to the TM-V7E, so it wouldn't really fit in our product range.

I don't think that these units have a built-in GPS - the adverts seem to mention connection to external units such as our own Japanese-market one. They are also designed to link to the home market in-car CD-ROM based GPS navigation system known as "Navitra". This is a merger between the CD-nav systems sold in car HiFi shops, and APRS/Ui-View. There isn't a comparable system in the west, mainly due to the cost of the CD-ROM hardware being more than Amateurs want to pay, whilst non-Amateurs don't want or need the radio aspects.

Re the Version 2 TH-D7E, this is the only model in our range where two Western countries have diverging models. As KISS mode was not of much interest to the USA, their version 2 radio, the (G) version, majored on changes to the GPS handling as that was more important to them. They are now quite different radios to suit local market conditions.

++
+++

I hope that this is of interest to the UK subscribers and maybe even the US ones.

Regards

Simon Hopkins
G8PXB

24. [htaprs] Smoke and Fire

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 4 Aug 2000 19:03:56 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-100665-2000.08.04-18.10.24--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

WHile I cannot even come close to matching the losses and sacrificies in the name of APRS as Steve (Lost his home to a Hurricane while at DCC, Lost much equipment to a recent burglary, and others), I had a minor skirmish you may find amusing...

I curse Sony and Zenith for their inverted power connectors.

The 14 USNA Boats got underway this morning at 7 AM, and I had 13 of them with working old zenith laptops when I left last night. On the way home last night, I realized I could just pull out my old Zenith from my car and do a quick substitution pierside this morning.

So, I did. I unplugged the laptop, but then dropped by my office to run in and use my personal laptop to calculate a V# for the Boat's call and then ran back to my car...

But when I returned to my car, black smoke was pouring out the windows! My between seats console was on fire, flames engulfing the laptop on all sides. I jerked it out (it landed open, upside down, about 6 feet away on the concrete. Now I could see the Kenwood D700 was in flames. I smothered it with an APRS T shirt, which also caught fire and had to be stomped to ashes.

Car was saved, nothing but the Kenwood and Tshirt was lost. Zenith Laptop still worked and was placed on the boat and they got underway with 5 minutes to spare. (All ashore thats going ashore... etc)

The forensics show that the (curse Zenith and Sony) inverted barrel DC connector which has +12 on the OUTSIDE had dropped between the seats and had contacted the seat mechanism. Since I had used a "normal" power cord with the Fuse in the + (center) lead, the (curse Sony and Zenith) outer (now +) lead was now in fact, unfused. Ergo, smoke and fire. THis lit the case of the D700 on fire which then provided the fuel to begin burning the console...

Actually, the D700 may still work. 50% of the plastic front cowling is totally burned/charred/melted plastic, both the Mic and front panel connectors are now bare burned copper and the plastic RJ connectors are all melted together. But once I carve them out, to remove the copper-to-copper shorts, we may just get lucky if nothing internal got burned. (Later... nope, its back to kenwood time...)

Curse SOny and Zenith...

ALso, PCElectronics (ATV MFR) used to put 12 volts on the tip of sub mini phone plugs to power his ATV downconverters. I guaranteed him that EVERY time you take ATV mobile/portable in a car, that TIP is going to hit something. In fact, it shorts every time you plug it in and unplug it! No big deal when you power it from a 50 ma wall wart. But a disaster when you power it from any kind of battery with your portable ATV transmitter. Even if you fuse it, you guarantee to blow a fuse every time you plug it in or drop it, or whatever.. Finally I convinced him how bad that was and he switched to standard DC barrels years ago...

So watch those plugs!

Oh, for a picture, see http://web.usna.navy.mil/~bruninga/KwdSmoke.jpg

Damn Standard too!

That's a heck of a mess Bob. Went to the trouble of firing up Comit and
going on line to retrive the jpg, Wow!
I once used a 1/4 inch phone jack as a DC power connection back when I was
a kid, never again.

Ran into the Standard non-standard approach, which is same as Sony and
Zenith, when my now ex picked up an HT of theirs at Dayton one year. Next
year I was back asking them what gave. Their answer, not a pun, was that it
was standard. Hmph! Apparently for "consumer" electronic devices. Told them
about 12 VDC swinging around the vehicle cockpit. They weren't as
interested as in the theoretical safety it gave them in either not draining
the batteries or what ever when a unit was plugged into external power. I
think something to do with the jack's switching of one side vice the other.
Told them I'd rewire it if it was mine. Cut traces and everything.

Matter of fact my trusty Tandy Model 100 laptop and portable drive use 6
VDC + on the outside of the coaxial barrel too.

Warranties don't cover fire, especially if caused by another
device.   Perhaps homeowner's insurance might cover the loss. I had a
buddy who had a mobile HF rig stolen out of his car.   Car insurance
wouldn't cover it, but his insurance agent asked if he ever used the rig in

his house. And when he said yes, it was in a quick-release bracket, and he used it often in his house, they cut him a check.

Rendered body type: text/plain

Like Tony I am using the SMA to BNC from Steve KC2BHO and have been extremely satisfied. The connector screws on tight and stays tight. I change antennas quite often and this connector makes it very easy without excessive strain on the SMA connector on the radio.

Like Tony I am using the SMA to BNC from Steve KC2BHO and have been
extremely satisfied. The connector screws on tight and stays tight. I change
antennas quite often and this connector makes it simple to change without
putting extra strain on the SMA connector on the radio. Like Tony I am not
getting any commission, but I am a satisfied customer.

Thank You,

John, W8UC

Which is why I whacked all sorts and kinds of connectors off my various
things and standardized on Anderson Powerpoles!! Added benny is that
everything is compatible with everything else in my car, shack, flying
machine, backpack, batteries, power supplies,etc.

Sure glad you weren't inside for a long session!!

FYI... Things vary from state in the insurance world. NORMALLY the auto
policy will not cover a ham radio without an endorsement to the auto policy.
They are not always economical if you calculate it out. However, any
smoke/fire damage to Bob's vehicle should be covered by his FTC (Fire,
Theft, Comprehensive) coverage on his auto insurance should he have this
coverage. The radio itself "MIGHT" be covered by the homeowner policy
depending on how it is written and unfortunately sometimes on "how" it is
reported to the company. Not saying to lie about it but sometimes they
don't understand the Ham Radio community and how our items work. There
"USED" to be a caveat in some homeowner policies whereby if the radio could
be powered off a source in your home other than the auto it was covered. So
Mark was correct in his statement below. However, there was an exclusion
something to the effect that if it was powered by the auto that it was
excluded. So we are back to the ambiguity. Then if you were "transporting"
the radio from one place to another in your vehicle it was covered by your
homeowner policy. Since I'm in NC our policies are a LOT different than the
rest of the world on occassion. Go figure... Unfortunately insurance

policies are written by politicians or lawyers generally and can be
ambigious. Guess I need to add a webpage about insurance sometime but then
that would require more research on my part!Hi. I can only assume my message
is as confusing as the policy itself. Hope it helps some. Bottom line is
REALLY read your policy and tie down your agent. BUT remember agents sell it
... They don't have to fix it or handle the claim generally. Might be
better to find an adjuster for your area and ask him for the real scoop!

I'm really wondering why there is so much titter about homeowner's policies.
The tilt on politicians and lawyers was unique, I live in NC and have never
had any question about any of my insurance policies. I have lived in NY,
FL, and NE and had no problems either. Maybe it's the democrats in office
here in NC that are causing an insurance ambiguity problem. I bet it is.

If the radio was covered under the ARRL insurance plan, there would be no
questions being asked about replacement of the radio. Yes, all of my radio
equipment is covered under the ARRL insurance plan, and has been covered for
several years. If Bob has this insurance, he's already contacted them about
it and a new radio should have been on the way by now. No adjusters to
figure out what a two-way radio even is, no debate if it is used inside the
house more than it is in the car, no worry that it won't be covered under
auto or homeowners...

Todd Ellis, N2XL

Bob. \
Has dissimmular experience with Kenwood 741 w/ head remoted.
Car has #4 fused +/- at both battery & trunk then to power distribution
block also +/- fused then to individual power cords also +/- fused.
BUT, Kenwood puts unfused 12v on remote cable to head, which,
of course shorted out. Resulted in remote cable burnt in half,
and trace damage to CPU and all three RF decks.
If the unit hadn't been mounted on shock mounted stainless steel plate,
fire in trunk or totaled car, would have occured.
Severe pitting on plate under remote cable burn through.
APRS & other radios in trunk would have been lost too.
           SAFETY FIRST, SECOND & THIRD !!!!   DB

33. [htaprs] SMA connector assembly

From: Stan Horzepa <stanzepa@mail2.nai.net>
Date: Sat, 05 Aug 2000 11:46:18 +0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-100868-2000.08.05-10.53.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone have instructions for the proper assembly of a male SMA
connector? My best guess at assembling the connector results in coax that
slides out of the connector, which is not a good thing for my D7A
transmitter!

Thank you,

Stan "clueless in SMA-land" Horzepa, WA1LOU

I just found out last month that APRS has standardized on one polarity
for the powerpoles(the one I have been using for years)
and that ARES has standardized on the opposite polarity.
My brother says Utah has standardized on the opposite polarity from
APRS. I just remember what mine is and look at it before using. It is

nice to be able to split them and reverse it, or install an ampmeter.

Reminds me of my standard C-78, that took power through a 2.5mm jack plug -
BUT with a slightly wider than normal bit of insulation between the tip and
the stem - a regular one shorts on insertion... :)   (ouch)

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101072-2000.08.06-19.21.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

G'day All,
        Well I was able to finially get my hands on a TM-D700A on Friday, what a great radio (and I thought my TH-D7A was good!)

One thing I have not been able to figure out is the sending of Status Text.
I have two Status Text messages stored via Menu option 3-9
The second one I have selected to USE is "VK5PC TM-D700 at home"
I can read this info into the PC when I save it using the Kenwood comms s/ware, so it is stored in the radio Ok

When I send a Beacon all that is received as the Status Text, by the TH-D7A or Ui-View, is a]
If I turn on the GPS Rx and select NMEA from the menu the Status text received changes to]"4I}
I have reset the radio and reloaded it from the PC with no improvement to the Status text received.
Position Comment (In Service), Position info (35.00.22S, 138.32.02 E), and Messages transmission are received Ok

By monitoring the channel I believe the data transmitted by the radio is,
>SPR0R2,Relay*,WIDE <UI R>:'B<#1 #-/]
(this copy of Eudora will not print a square solid block so I have replaced it with a #)

What have I missed ? its gotta be something simple (I hope!)

One thing I was disappointed with was that the VOICE REPEATER funtion has been disabled, although it is still in the menu.
How can this feature reactivated for my TM-D700A (export) model ?

Any help you guys can give me will be much appreciated.

I have a Sony cd player and my son has a Sony cd player , each one has
diferent polarity. for the 12 vold plug to 9v. they both use 4 aa cells,
but none of the accessories interchange.
 but the power plugs fit, just dont work because of the bloking diods..
I hate Sony for there dumb things. every month they go from 9 volts to 6
volts then to + polarity then to - polarity then back to 6 volts and it
just keeps on forever.
Most of my new american made stuff runs on 6 to 32 volts center pin
positive. With a very efficient switching power supply.
It is a nice standard because you can use it in your car a 24 volt truck
or an airplane.

41. [htaprs] Interesting THD-7A(G) APRS+AS Problem

From: kk5yy@arrl.net (Gerald Schmitt)
Date: Mon, 07 Aug 2000 02:16:18 GMT
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101087-2000.08.06-21.22.48--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Howdy Guys,

After functioning quite perfectly for a year now my THD-7 no longer
gets along with APRS+SA. G mods were installed at Dayton and
it seemed to work fine between Dayton and Indianapolis.

I noticed on the way to Flagstaff that suddenly my moving map wasn't.
A quick poke of tie "POS" button revealed that once again I was at
00.00.00 by 00.00.00. This is after working perfectly for several
hundred miles.

If one switched the THD-7 to beacon it immediately locked up
with the GPS and began beaconing my correct position.

I have tried this several time since then and have had much the
same results. The program starts and functions for some time
then the radio can no longer read the GPS data stream.
Something seems to be changing the setting of the GPS port
in packet mode.

I have tried other GPS units with the same result. Any suggestions
would be most welcome.

Rendered body type: text/plain

Does anyone have any suggestions for mounting the control head of a D700 in a '99 Ford Explorer? The radio itself, fits fine under the back seats... plenty of breathing room when even when they are folded down.

Also, where might the best place for the power source be? It appears there is no easy place/way to get bridge through the firewall. I am currently utilizing the utility plug on the console, but with after reading the latest "Up In Smoke" stories... I really don't want to utilize it as a permanent power source.

I installed a remote radio in an explorer with a friend. We ran power under the vehicle using good-oil and weather DC zip cord. If you look under the passenger seat behind the driver, there is a gap in the carpet. Under the carpet is a rubber grommet. You can put the power up into that grommet (use silicon to seal it). The radio can mount right there as well. For the control head, check out the mounts at Panavise (www.panavise.com). They have mounts that attach beside the radio or A/C controls. A small piece of metal comes out next to the trim (no holes). You can then put the "fins" of the D700 mount straight up in the air parallel to the radio. The holes on the D700 mount match perfectly to the Panavise mount. If you order from Electro-Comm (www.ecwest.com) you can usually get the mount at cost ($16).

The great part of this mount is that the radio is up where you can see it. With the D700, you tend to look at the display, so the closer it is to your windshield, the better. Resist the temptation to install it on the console because you end up looking down too much.

Good Luck,

Tom NY4I

I had the same question a while ago. The answer I got was that the]"4I}
type information was the altitude in MIC-E format. From the line you
displayed however it doesn't appear that you are sending a status text
thought. You might want to check to see what the status text transmit rate
is, its menu 3-A. The default is off from the factory.

Hi all,

I am looking for an alternate APRS frequency for use in the mountains to
track my dog (that's right, track my dog) I am experimenting with a doggy
pack that has the TH-D7A, and a GPS. (no Palm Pilot as she can't read the
darn thing anyways) But don't want to disturb others that are running APRS
as the real thing either. Is there an alternate frequency that is
recommended for this?

Careful, K9DOG is a real ham, doggone it! Look it up if you don't believe
it.

I have clients (I'm a comms consultant) looking into vehicle location
services for those wanting to know where their vehicle is located, ie. where
your teenage daughter has driven the family car. The biggest problem with
using APRS for this type of work is that if you aren't there and she doesn't
have a ham license, Riley might pull her over and give her another kind of
traffic ticket.

50. [htaprs] Kenwood TH-D7 upgrade

From: Mark Fellhauer <sparkfel@primenet.com>
Date: Mon, 07 Aug 2000 17:06:34 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101313-2000.08.07-17.14.08--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Several people have posted that they have not been happy with the
turnaround times provided by Kenwood for their firmware upgrades.

Here's my story:

July 17, 2000 - sent my TH-D7 to Kenwood Service Center West via USPS
Priority Mail, insured, return receipt requested. I gave them written
permission to bill my Visa Credit Card for the upgrade and return shipping
as well as my home phone number, return address, and email address. I have
an answering machine on my phone turned on 24 hours a day, as I work a
differential shift.

July 20, 2000 - Radio recieved and signed for by Kenwood - The person who
received it for Kenwood both printed and signed their name totally
illegibly.   Nice for them to make sure it can never be traced to an
employee...   Unless they really have an employee who is named Marug Agegipitz.

July 30, 2000 - Having not heard from Kenwood I emailed them for status on
my radio.

July 31, 2000 - Received a reply from Kenwood saying that I'd have to call
them for status of my upgrade.

 From July 20 thru August 7, 2000 - I have never been contacted by Kenwood
in any manner, despite the fact they have my home phone number, home

address, and email address.

August 7, 2000 - Due to several circumstances, including a death in the family, I was not able to call Kenwood until today. I was told my radio was received, and in their computer (home phone was correct). BUT THEN --- I was told they couldn't give me status on my radio over the phone. The woman hemmed and hawed for a while and said she'd have to call me back. She didn't sound like this was routine. As a matter of fact, she sounded nervous or distressed (I work for a service center, and I can pick up on that). So far, after an hour, no return call.

THIS DOES NOT BODE WELL.

73,

Mark

52. [htaprs] D7G Positon Comment ?

From: "Jim Morrison" <km5bs@hotmail.com>
Date: Mon, 07 Aug 2000 22:50:57 GMT
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101318-2000.08.07-17.57.03--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just got my D7 back from KW west. In looking at the software, the radio and the manual, I find several new Position Comments: CUSTOM 0 thru 6. The manual has one small footnote about these saying they are "personal definition". Is there a way to program a text message in these or are they to be used by prior agreement with other stations (e.g.: 3 = at home, 5 = at the lake, and so on)?

Just curious if anyone has found a way to program anything other than the canned messages in the Position Comments????

BTW, I sent my D7 in, waited a week after it got there and called last Wednesday. The lady had to call me back (in about 15 minutes). She said they were working on it that day and it would go out that afternoon. At my request, she sent me the UPS tracking number later that day and it finally made its way home today (Monday). I'm very happy with the service - they told me five to seven working days turnaround before I sent it in & they were right on the money.

Rendered body type: text/plain

As far as I know of the Custom 0 - Custom 6, display just that. I guess they mean that you have to know what you(or others) have decided Custom 0 - Custom 6 to mean. Still, it would have been nice to be able to put a real posit comment in.

54. [htaprs] Brains for a D700?

From: Chris Arndt <carndt@slonet.org>
Date: Mon, 7 Aug 2000 17:51:36 -0700 (PDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101349-2000.08.07-19.58.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Some list members have in the past posted shortcomings they have found with the D700s operation or programming.

Others here have explored the serial port on the D700, and determined some commands to control it. I don't recall enough of the details of that to know if what I came up with is possible, so I thought I'd ask here.

Is there enough control capability in the serial connection to make worthwhile an outboard D700 controller that would add some of the functions we'd like to see?

Such a controller could be PIC or Stamp based, and do such things as automatically change the BCON rate when the ignition is on or off, or maybe even dynamically change the BCON rate as the vehicle speed changes.

It could maybe change other parameters based on location, like the STATUS messgage or even what frequency is displayed in the B band.

I think I recall that the D700 also streaming incoming packets or messages out the port. If so, the controller could respond to incoming messages, too.

Is this possible? Any other cool ideas?

I've done some Basic Stamp programming in the past (XRACS, the DTMF controlled synthesized voice response X10 controller http://www.tbo.net/html/xracs.htm, which brings up another question.

In that project, I used a text to speech board to respond by voice to DTMF commands. Is the data coming out the D700 port in a form to be useful squirted through a board like that?

Chris

Mark,

I hope your luck gets better. I recently purchased a D7A(G) and had to send it back for repair - I got stung by a wasp and fell on the radio trying to avoid anymore dive-bombing raids on the back of my neck. It has been a month to the day today since they received the radio. I called the service center (East Coast) and gave them my claim number (doesn't appear from your posting that they sent you a post card with your radio's info) from my post card. The lady was helpful in stating that they're waiting for a back-ordered part.

All of this was to tell you that they do indeed give you the status of your equipment - someone has apparently misinformed you.

GL es 73,
Joel, K2SAT

> the lake, and so on)?

THats all. Remember, they are only a single bit in the actual packet, so
the definition of what they men is up to you. The original Mic-E messages
were pre-defined, but user feedback wanted some new custom ones that they
could define.

As you can imagine, if any software allows anyone to define them at will,
then there will ALWAYS be missinterpretations as your definition might not
match mine. Thus, in SOFTWARE we are resisting ANY effort to assign
permanent meanings.   THus, YOU and ONLY YOUR INTENDED RECEIPENT must
decide beforehand what the TWO OF YOU want it to mean. Then and only then
can they be used without ambiguity...

I hope this helps...

de WB4APR, Bob

59. [htaprs] AUTOMATIC POWER OFF - D700

From: "Ronald G. Parsons" <w5rkn@amsat.org>
Date: Tue, 08 Aug 2000 06:28:47 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-101436-2000.08.08-06.34.36--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The AUTOMATIC POWER OFF function does not seem to function properly when
the D700 has one band in APRS mode and beaconing or digipeating. The
manual says:

AUTOMATIC POWER OFF (APO)
Automatic Power Off is a background function that
monitors whether any buttons or keys have been
pressed, or whether the Tuning control has been turned.
After 3 hours pass with no operations, APO turns OFF
the power. However, 1 minute before the power turns
OFF, □APO□ appears and blinks, and a series of warning
tones sound.

However, my unit does not shut off even though no buttons are pressed.

Is this a bug? Is there a workaround?

APO only works if no buttons are pushed by you, OR NO
signals heard on either band for the alloted time
specified in APO... As soon as a signal breaks squelch,
the APO function is reset..

Good luck

Robbie

Rendered body type: text/plain

Has anyone else experienced weird jumps in the hour of the
D700's internal clock? I set it either via the GPS or manually and when
I look later the hour is way off time. Sometimes it's even over 23 and
as high as 38. Every thing else seems to function properly.

Is there an internal battery for the clock that may be dead?

This is my second D700 and I just bought it the end of June. The other
one doesn't have this problem.

Any suggestions would be appreciated. Charlie

Those special custom 1 through custom 6 bytes could cause a very smart
SATGATE to foreward the downlinked position to one of seven predefined
email addresses. This is what ORBCOMM does and a PIC or Basic stamp
controller or other program at the SATGATE could search for them in the data
stream. and add the addresses. This ties in with the ongoing discussion of
uses for these bytes.

The eMap has turned into a fine GPS and is probably about the cheapest
mapping GPS you'll find. BTW, I'm told a new revision of the firmware 2.52
is set to be released.   This should fix some of the problems the eMap has
setting up a track during slow speeds (like as in hiking).

The best deal I've found online is Softwarebuyline.com.   The eMap Deluxe
(includes PC cable and 8 meg data cart) is $226.00

http://www.softwarebuyline.com/

I got mine at Reed's Sporting Goods in Walker, MN.   A really cool place to
shop if you ever find yourself in Walker.   Their online price is $299 for
the eMap Deluxe, but they cut me a smokin' deal and I paid about the same
as the softwarebuyline price.   But it cost my friend Steve (KB0WSV) his
hunting cap (a long story).

http://www.reedssports.com

I like the form factor and the eMap better.   Plus the eMap Deluxe street
price is $50 to $60 dollars less than the III+.

Here's where the eMap beats the III+:

1) Uses only 2 AA cells, so it's lighter
2) More routes and waypoints per route (50/50 vs 20/30)
3) Display slightly larger with better resolution

4) More tracklog points (2000 vs 1900)
5) Audiable Alarms
6) Waypoints store altitude info

The only advantages I see to the IIi+ is that it runs on a wider voltage
range and has a better water resistance rating.

73,

Mark

sparkfel@primenet.com writes:

<<
 1) Uses only 2 AA cells, so it's lighter
 2) More routes and waypoints per route (50/50 vs 20/30)
 3) Display slightly larger with better resolution
 4) More tracklog points (2000 vs 1900)
 5) Audiable Alarms
 6) Waypoints store altitude info >>

Hi Mark, is there software with it that allows you to upload and download
waypoints, modify them off line?

Whats the deal on maps? All US?   any Canada?

Lots of HTML in the different TAPR list's these days.

HTML is hard to read on my palm when I check my mail
and it never works in the TAPR digest mode.

Most other computer mail list will convert or bounce it back with a note
to the sender.

even when using the new Eudora that does display HTML
people keep using 9 point type - requiring another step to read the mail.

if the list mom could help let us know if the rules about
attached files and HTML have changed.

Would someone explain to me what the "T" terminal is on the back of the
PB-39 pack? Between - and T i measure zero, between - and + I measure 9.72v
(of course), and between T and + i measure the same. I measure 8k ohms
between - and T with the DVOM.

But I still have no clue what it is :-)

Mike,

I always assumed it was a thermistor to detect and avoid overheating during
rapid charge. I have no evidence to support this, though.

Try putting it in the refrigerator for a couple of minutes and measuring
the terminals again. Don't freeze your battery though!

A question for the group...I have a D700, and was setting up a second mobile station using an ADI mobile
 with a Kantronics 9612 Plus TNC. I set it up per the Kantronics book (darn big one, bigger than the
product!). However, when it beacons, I see two question mark signs ("??") on my D700 and the second
unit does not show up when I press the LIST button on the D700. I have seen other trackers in my area
display the same "??" and also do not show up on the list. What have I not set on the Kantronics unit?
  Am I missing something? Please let me know if you have any insight!

BTW, the use for this box is for my wife who is also licensed. I just bought her another car and plan
to utilize APRS with her call on the TNC for the security system concept.

> However, when it beacons, I see two question mark signs ("??") on my D700

This means its a packet that the D700 doesnt know how to decode.

Remote Wx stns (using Peet $ULTW) do this also. Its a shame that the
software in the D700 doesnt decode whats actually seen over the air in
hundreds of
operational areas. I would have thought that since all versions of APRS
(like Winaprs, MacAPRS, APRSdos, and APRSsa) can decode the stuff seen over the
air, a D700 could too. I am disappointed in how many packets are not
decoded by the D700.

Rendered body type: text/plain

Okay, earlier I measured the following:

- to + , 9.72v
T to +, 9.72v
- to T, 0.00v, 8.02Kohm

After being in the fridge a while....

- to +, 6v and climbing (warming up to room temp)
T to +, 6.35v and climbing (""   "")
- to T, 0v, 10.85Kohm and _falling_.. Which would make sense if it's a temp
sensor.

Issue settled? I'm satisfied :-)

If you want to see the raw WX stns on your mobiles, you can have someone
in the area run APRSdata.exe and enable WX-RAW-CONVERT. It will take the
RAW WX reports and convert them to APRS standard format and retransmit
them. This does double up on the number of WX packets on the air, so will
probably only be good to do in sparse areas where the extra load will not
be noticed..

Ah, but they are big programs. APRSdos is over 10,000 lines of code.
They couldnt put all of that in an HT...

Hi All,

Is it just me or is the Packet baud rate (not APRS) global
without a menu option to change it from the radio ?

It appears that you cannot have one PM configured for
1200 baud in Packet mode and another set for 9600 baud
in Packet mode.
Further more I cannot find a menu option in the radio that
will change the baud rate. There are menus to change the
APRS baud rate and a further menu to change the setting
for the external data connector socket but not for the
packet mode. The only way I can see of doing it is to put
the radio into command mode sending CTRL 3 and then
send HB1200 or HB9600.

Shame that the setting is global eg applies to ALL PM.

Anybody found another way using the radio to change the
setting ?

Good answer! Well, I used the BLT command just like the book said. One
other respondant (Tom Shaefer) suggested that I turn off the HID parameter.
I'll try both of these later today and see what helps! Thanks.

Two Questions:

What kind of power connector does it use? (I'm assuming it is NOT the same
as on the GPS II+ and other Garmins). (And if not, where would you get the
appropriate power/data cables).

What kind of data i/o connector does it require?

I'm assuming it will plot callsigns as waypoints from the D7A(g) and D700A?

Looks interesting as an eventual replacement for my older firmware II+. Does
it have a larger display than the II+ ?

(I know...that's 3 questions).. tnx

One thing you can do is select the P.MON mode of the radio and see what it is receiving from the other TNC.

Personally, I would not worry about this much as the D700 is going to receive ?? from certain packets. it is just a fact of the radio's life. I do not find it a problem because it decodes everything it is supposed to decode for APRS.

i have been unable to make my icon pop up on winaprs.

the data stream looks like this with no gps

kd8s-14>svrstp,relay,wide:'+2j1lk\s

there is no long lat string, manual put in my coords.

tried full reset

any ideas? is there something i have to set up in the packet mode related
to aprs?

73
find me on a map! go to http://map.findu.com/kd8s-7 works only
if i am sending my position out and in satellite range

The data you list below shows '+' after the call sign..

I am used to '>' instead. This would make a BIG difference, and
would explain why it is not working.

I have a D7G and it works fine, and displays '>'. Please verify that
this what is coming in, and contact me via phone..

86. [htaprs] Kenwood D-700 APRS Speech Contest (deadline extended)

From: Keith Sproul <ksproul@td.rutgers.edu>
Date: Sun, 13 Aug 2000 19:11:26 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: Keith Sproul <ksproul@vger.rutgers.edu>
Message-ID: <LYR845-102492-2000.08.13-18.17.35--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The deadline is September 18th. Please send in your entries.

```
=====================================================================
====        Kenwood D700 APRS(tm) Speech Message Contest       ====
=====================================================================
```

The Kenwood TM-D700 Radio has the ability to have a speech synthesizer
added to it. If you add this option, you can make the D700 'SPEAK' or
actually 'SPELL' APRS messages.

When you send a message to a D700 with the VS-3 Speech chip, it will SPELL
the call sign of the station that sent the message.

In addition to this, if you put a percent sign '%' as the FIRST character
of a message, it will SPELL the letters and numbers of the message.

For example, if I send the following message from WU2Z to WB4APR,

        %ICU2

Bob will hear:

        DOUBLE-YOU YOU TWO ZED I SEE YOU TOO

We are announcing a contest to see what kind of messages people can come
up with for using this neat feature of the Kenwood TM-D700 radio and the
VS-3.

```
=====================================================================
```
Rules for the contest:

* There will be three categories:

        The LONGEST message that makes sense.

        The MOST TECHNICAL message.

        The most original or funniest message.

* The winners will be announced at the ARRL Digital Communications
Conference in Orlando, FL, September 23, 2000.

* Each winner will receive a $50 gift certificate from Kenwood Radio.

* APRS Authors and Kenwood employees are not eligible.

* The judges will be the APRS Authors and Kenwood personnel that are
present at the September 2000, ARRL DCC in Orlando, FL.

* All decisions of the judges will be final.

* All entries must be sent by email ksproul@noc.rutgers.edu by September
18th, or delivered in person at the DCC.

* PLEASE put D700 CONTEST as the subject of the email!!!

* You must have a valid Amateur Radio License to enter.

* You do NOT need to own a Kenwood D700 or VS-3 to enter.

* You do NOT need to be a registered user of any version of APRS to enter.

* You do NOT need to be present at the ARRL DCC to win.

* In case of a tie, i.e. exact or very similar duplicate message the
earliest received entry will win.

* In case of other ties, the judges opinions will determine the winner.

* All entries can be used by Kenwood and/or the APRS authors for demo
and/or advertising purposes. All entries will be posted on the Web after
the contest, with your call sign to give you credit.

* Entries that imply profanity or inappropriate content will be ignored.

==

The documentation for the Speech functions of the D700 are at:

        http://aprs.rutgers.edu/D700Voice.html

There is also a copy of it at:

        http://dorm.rutgers.edu/~ksproul/D700Voice.html

(If one is down, try the other, I will keep them both updated)

If you have questions about this contest, or how the Voice option works,
please send email to me at: ksproul@noc.rutgers.edu

As questions come in, I will update the documentation if needed.

You may distribute this announcement to other places, but you must leave
it exactly as is.

just got my gps feeding the thd7. even with good rmc still does not spit
out my position....

i am going to guess i need to get into the packet mode and check some of the
settings.

i can compare the old settings that i printed out last year and make sure
they are the same.

anyone else have a problem with the thd-7 g not working with winaprs after
the upgrade? what did you do to fix it?

Byron and others who answered my call for help last week:

After wasting 3/4ths of Sunday working on this problem, I have found some interesting issues. First, if
 you set up the KPC9612+ to only beacon, it will be successfully decoded by the D700 and also show up on
 APRS+SA (my two test setups). This is where the fun departs...

If you are also trying to get the lat/long GPS data to be filtered into the LT text position, it does
not parse the location information in a way that APRS+SA nor the D700 like to see, and thus I get the
dang "??" message again on the D700, and nothing at all on the APRS+SA! If you look at the outbound
data packet for $GPGGA or $GPRMS with this unit, you will see each data component being comma delimited.
  If you look at any other location info from APRS+SA or the D700 or other stuff too, the lat/long is
not only formatted differently (3354.76 versus 33, 54, 76), it also has a slash "/" between the lat and
the long. I was really ready to beat my already flat head onto a hard surface when I realized nothing
squirting out of the 9612 was going to work. Oh, and BTW, the Xmit light on the second port turns on
and stays on after the very first location report. I am calling Kantronics today to verify this stuff,
and why I can't seem to get this unit to work less a computer. There HAS to be a good answer.

I'm sure this is a case of calling the kettle black, but as a consultant working on various mobile data
systems for clients all over the country, this system (APRS/AX.25) seems far too complicated to get
working for a newbie (Bob B is making a dartboard from my picture on QRZ.com right now). In fact, I
found two web pages from two sites that had two very different suggested setup parameters for the TNC.
I ended up using both and throwing out what I figured wasn't usable as I went along. Maybe this is why
there is a hesitancy for folks to get involved with APRS, and why of the VERY few trackers in the
Raleigh, NC area are all D700s or D7s. The rest are fixed stations using APRSdos or WinAPRS or APRS+SA!
  Johnny-come-lately and all (I started working qith APRS in January of this year), I have to believe
that all the other stations (I counted over 10 locals yesterday alone) I see with "??" coming up on my
display are having the same kinds of problems and are chaulking it all up to "I probably don't know what
 I'm doing, this is as good as I'm going to get it". My third APRS project is about to fold in
disaster, and for the amount of money invested, I could have bought another D700! This truely isn't

rocket science unless you count the 9612 I almost threw into a ballistic arc, but we collectively seem to be trying to make it be that way; I have had only a couple of responses from posts for help.

Make sure your tnc has the command to set MFILTER OFF...whatever it might be...I had mine set to $80 from some other app and it caused the icons to not show up, only a red dot.

All of this can be solved if you simply send us a copy of the packet that
the TNC is generating and that is not showing on your system.

Be happy to help then. But unless we can see the problem, we can't fix
it.

bob

Rendered body type: text/plain

Gentlemen

I had gotten accustomed to leaving my GPSIII + KPC-3 + Htx242 ht tracker on
all the time when it was in my truck. I also used to leave my RatShack
HTX-242
mobile turned on during the same length of time with no dead battys.

Now that I have the D-700, I have run my battery down 2 times, to the point
the truck would not start. Last week, I jumped it, and it was ok. This
morning I had to put the charger on it. TMD-700 was left on since friday
evening after work, saturday & sunday, & monday till 8am. Even the D700
shut down as did the gps. I suspect the batty voltage went below 9v or so
to cause that.

Has anybody else experienced this radio draining a vehicle battery after
about 63 hours?

I did not think this radio drew that much power, but evidently it does.

Is there a way to reprogram the autopoweroff mode to ignore squelch openings
and only respond to button presses? Otherwise, in APRS mode, it will never
go to sleep.

Rendered body type: text/plain

Put a multimeter on the thing and see how much amperage is being drawn by
the radio/GPS. Disconnect the radio and GPS and look for other phantom
loads (you may have something drawing more power than it should). One you
know how much power is being drawn from the battery with the truck off, it
should give you an idea of how long it will take to drain that battery.

Your battery may just be getting old and doesn't have the capacity it once had.

FWIW, this is but a tiny fraction of what the HamHUD does, using only 8.4K of
program+data space:

. Display temperature and wind data from stations w/Davis and Ultimeter II
weather units (incl. $ULTW & !! formats)

It shouldn't be too difficult for Kenwood to incorporate weather packet
parsing into their next firmware release. Bob, you might ask them if they can
get themselves a better compiler. :-)

73,
Tony KD7TA

Ed,
  The amount of current consumed over 63 hours would be dependent on a number
of factors.
The radio can draw 11.5A or less at maximum power setting (50 watts on 2
meters) when transmitting.
While receiving (at 2 W output) current drain is 1.0A or less.
The dimmer setting will affect current consumption as well.
Each time the radio keys, the fan runs for a period of time.

Other factors :
Packet transmit interval (0.2 to 30 Minutes)
Status text transmit rate.
Digipeating.
Condition of battery and charging system.
Battery Amp hour rating.

If the D700 transmit interval is 1 minute, the unit will transmit a minimum of
3780 of location packets during a 63 hour period. If the D700 is set to to
beacon status text every 3rd location then the total packets transmitted is
1260 + 3780 = 5040 packets.
If the average transmission length is one second then the length of time the
D700 transmitted is about 5040/60 or 84 minutes. The radio consumed
approximately 16.1 ampere hours while transmitting.

You must factor in the amount of current drawn by the fan, backlighting,
receiver, and GPS. If you assumed that this amounts to about 0.75 amps/hour
then an additional 47.5 ampere hours would be required during a 63 hour period.

If the above assumptions are correct, your battery must supply 63.6 ampere
hours over a 63 hour period.

The location packets you transmitted during this interval were essentially
identical. Not sure what benefit can be derived from continually transmitting
static locations. I have never used the APO function since I always turn off
the radio when the vehicle is to be parked for any length of time. The manual
indicates that the APO function timer is reset when any buttons, keys have been
pressed, or when the tuning control knob has been turned. It does not state
that squelch openings will affect the APO timer.

Hey Brent/Bob:

I'm using a Garmin GPS12, and later I will transpose all of the parameters I have entered into the TNC. The Garmin is set up for NMEA, and have tried NMEA 180, 182, and 183 1.5 and 2.0 at 4800 baud. The Garmin is running version 457 firmware. I have used $GPRMC and $GPGGA. I will also cut and paste a transcript of the packets that the TNC is sending per Bob B.'s suggestion.

Maybe we can get this thing working yet! ;)

Leave it at 4800 baud, latest NMEA version (2.x). Either GPRMC or
GPGGA sentences should work, depending on what you set your TNC to
look for. GPRMC gives you speed/bearing/lat/lon, while GPGGA gives
you altitude/lat/lon. I prefer GPGGA myself 'cuz I'm a leadfoot...

I don't have any Kantronics TNC's, so that's probably all the help
I can give on this problem.

  I would rather suspect you have a weak battery ... that point aside,
you say nothing of beacon rates and power settings. If you need to Hi
power to get into the nearest digi when you are parked I would suggest
that 30 minutes is the barest minimum beacon rate (the only reason I
even suggest it is if you may feel some overwhelming compulsion to
always appear on the Java APRS web display which only shows station with
a 35 minutes recency) Preferably it should be one hour. Then again, if
you are not moving for 63 hours the GPS is rather superfluous wouldn't
you say? Unless you are parking your truck 30 miles from home. I would
say set it to low power, digipeat through your home station once an
hour. That is what I do here

> Has anybody else experienced this radio draining a vehicle battery
after
> about 63 hours?

 I ran my D700 in my '91 Blazer as a digipeater on hi power at the
Rochester, NH hamfest for 24 hours with no problem.

> I did not think this radio drew that much power, but evidently it
does.
>
> Is there a way to reprogram the autopoweroff mode to ignore

  I gotta ask ... why bother? Why leave it on in APRS if you want it to
go to sleep? You cannot have your cake and eat it too!

Ok Gentlemen

Bill did an estimated 63.6 AH current drain just from the rig.
The GPS uses mimimal current, it can run off of penlight batts,
but it too is running off the Truck battery.

This leaves 3 possibilities... Either my truck batty has only
about 61 AH capacity, or my batty is going bad, or there are
additional loads taking place through my electrical system.

My current plans:
1. My D700 is going to be shutoff when the engine is off.
2. Im going to carry a notepad and digital volt meter with me
   and monitor my batty voltage to search for losses.
3. Im gonna keep jumper cables behind my seat!

Thanks for the opinions and math work!

My TM-V7 is also a power hog at idle. It draws enough to freak out my
security die-hard even in as little as 6 hours.
60-ish AH isn't a big suprise for a car battery. They value peak current
more, and pay a penalty to make it rugged enough to stand all the shaking
and heat.

Ed,
  Turning off the D700 will conserve your precious battery, and our precious
bandwidth. Sounds like a good plan to me.

Rendered body type: text/plain

I would also like to add that automotive batteries are now being asked to
do things they were never designed to do, and that these batteries are now
being designed to be lighter, which actually lowers their operational
life.   I had a problem with my Chrysler LeBaron convertible discharging
batteries after just a day or two of non-driving. Even with no ham radio
equipment connected, the drain from the radio/clock memory, the car's ECM,
and two alarms (siren & pager), plus the evap emissions purge valve would
be enough to discharge the battery to the point of not being able to turn
over the starter if the car sat for more than 36 hours.   The problem was
made worse by the fact that the car was driven about 14 miles round trip on
any given workday, which is not even close to enough to charge an already
taxed battery.

I will admit that I live in places with extreme temperatures. 14 years in
Phoenix and now two in South Dakota. In Phoenix 110-120 degress F is
common in the summer, where in SoDak we have several weeks in winter where
the REAL temperature can dip to -30 F or less at night (and not any of that
wind-chill factor stuff - I'm talkin' -30 w/o considering wind).   Plus
the wind chill factor here is a big deal, since I do live along what
meteorologists refer to as Buffalo Ridge, the 2nd windiest (habitable) spot
in the continental US.   The only place worse being Minot, ND.

http://www.me3.org/issues/wind/

The heat and cold really give an automotive battery a beating, so about two
years ago, after repeated problems with batteries going dead, I went out

and purchased an Optima "spiracell" deep cycle battery. Problem
solved. Yes, it was 3 times more expensive than an average car
battery. But knowing that my car will start when I leave work at 11 PM in
a South Dakota January is worth every penny. Sure, the security people at
work will come out and give me a jump start. But have you every tried
doing this when the wind is blowing 40 MPH and it's -30? It's really hard
to push-start a car when there's 2 feet of snow on the ground...

http://www.optimabatteries.com/main.htm

Other benefits are that the battery has the reserve capacity to power all
my APRS toys and still start my car.

The only problem I had was finding and installing the battery. I had to
go to several car parts stores before I found one that would order the
battery for me, and then the Optima battery is a little taller and fatter
than the battery designed for my Geo. I had to modify the battery tray
slightly and re-route the battery cables. All of which took about 1/2
hour. Well worth the effort.

??? I do all my running within 5 miles, and most trips are under a mile.
I have run the battery flat, charged it enough to barely start, then drive
two blocks away, shut it down, come back in half an hour, and you can't
tell it's not full charged. My alternator puts 80A into a near depleted
battery just a little above idle (in addition to running all vehicle loads)

I might check out that optima as a second battery for the radio gear though. :)

If you actaully look at the charge rate of a modern vehicle you would see
that it would take several hundred miles of driving to fully charge a
battery that had been discharged to less than 10 volts. Yes, you may have
an 80A alternator (my LeBaron had a 90 amp job, since it had power
everything, including the "star wars" dashboard), but the regulator
actually only lets through a few of those amps to charge the battery.

Most battery manufacturers recommend using a charger on a battery after it
has been discharged to a point below where it can't crank a car, even after
a jump start. I would recommend that every ham invest the $25 or $30 in
an underhood trickle charger and at least once a week pull the specific
gravity or voltage on their battery and then charge the battery as
necessary. If you buy a charger with automatic float, just hook it up once
a week overnight.

I wish I could say the same. Sent my TH-D7 to Kenwood West July, 17 - it was received by them July 20th. On August 7, called them and asked for an update on the status of my radio as I had heard nothing from them to that point. The person on the phone couldn't find the status my HT (it was in the computer) and promised to call me back right away. That never happened. On August 8th called Kenwood again. Spoke to Carmen, she said she whould have to check the status of my TH-D7 too, and would call me back. An hour later Tina called me back and gave a standard "Corporate Apology/Non-apology," but said they did indeed have my HT and would put a rush on it. She said the update would be done that day. Well it's now August 14, and still no TH-D7. We're fast approaching a month. I guess I'll call them tomorrow and see what their story is this week. It should be entertaining. :) Maybe they'll get it back to me by September? Anyone want to start a pool?

73,

Mark

That's 80 A into the battery, exclusive of the load. Measured. I didn't think to measure the total output of the alternator, it wasn't what I was looking for at the time.

I'd love to, but mechanical considerations make it difficult.
I've thought about solar panels too, but after that last hailstorm, I don't
think I'd go for that either...

As you all know I have been asking about the alternate frequency for APRS.
As it comes up I have decided to go with the regular frequency for the APRS
to be able to track my dog with pack on tromping through the forest. I have
a GPS wired to a HTX-202 (Yes, I still have one) to avoid the D7A getting
banged up. I will be running this test next weekend for all who want to see
if we (the both of us, dog and person) show up on findu.com I will be N0WRE
and will have the note Chest pack and my dog will be N0WRE-1 with the note
doggy pack. If you can find either of us let me know as we will be in Estes
Park for the weekend so there may or may not be a signal on findu.com

Tanks for all the information you submitted for my asking.

You can get a device called a Charge Guard CG-12D that will do that if you
can't get the radio to do it. I put one in my wife's 4Runner to control
her D700, and the cell phone. It can be set from a few minutes to a couple
of hours (I think). It's smart, and only has 3 connections. Battery, load
and ground. It operates by sensing battery voltage, and will shut off on
low voltage as well as time.

Assuming that the vehicle is being operated with fairly minimal loads right
after being started (not comfortable in some parts of the country, for
sure!) then most of the current capability of the alternator should be put
into the vehicle battery, to bring its voltage back up. This DOES assume
that things like the blower motor, A/C compressor clutch, head lights,
engine cooling fan, etc. are NOT running, i.e. daytime running conditions in
temperate climate conditions, with accessory operation disabled. If under
those conditions immediatly after starting the vehicle, you see low charge
current, goose the engine a little. If the charge current is still low,
then it's time to suspect the resistance of wiring between the battery and
alternator. If the alternator is voltage-limiting (not current or capacity
limiting) at that point, then you have a high resistance point in the
charging system. Note that if the battery has not been being discharged by
alternate loads (like leaving radio gear, headlights, etc.) turned on, that
high-current charge phase will not last long, perhaps 5-10 seconds, because
all that's being done is returning to the battery that energy taken out to
crank the engine. Of course, with most vehicle instrumentation, there's no
way to tell - you have to use alternate means to monitor the charge current,
and techniques that don't impose any resistance in the circuit, otherwise
you're creating the circumstance you're trying to confirm. One method (that
comes at significant cost) is to use a DC-capable clamp-on current sensor to
measure current flow in/out of the battery. Fluke offers these, but as I
recall, the going rate is about $180. An ammeter with a beefy (and hence
low voltage drop) shunt could be used also. Measuring the voltage
difference between the alternator output terminal and the positive battery
post would be a good indication - you should never see more than a 0.5 volt
difference between these spots unless you're using a diode isolator for
running a dual-battery system. In that case, do two voltage measurements -
from the alternator to the anode, and from the cathode to the battery.
Anything more than about 0.1 volts drop warrants your attention, because
with the internal regulators standard on most alternators, the 0.7 volt drop
of these isolators is already dropping the available regulated voltage for
fully charging the battery to marginal levels. By the way, a favorite spot
for low charge current due to high resistance to creep in is at the main
power connector through the firewall. This is a spot that can be subject to
corrosion and moisture, and sometimes the charging path to the battery
involves passage through this big multi-pin connector. This has happened to
me - and it took a while before I figured out that a loosening connector was
the cause of low charging current and wide voltage swings under heavy load
conditions. The battery tried to make up where the alternator could not
(idle conditions with all accessories running) like it's supposed to, but
the high resistance in the connector meant that the voltage to lights and
fans was dropping to about 9 volts - very obvious - at stop lights.
Unfortunatly I found a direct replacement for the single terminal in the
connector block unobtainable, so I ended up wiring around it. When I did
so, normal operation (as I had been used to it) was immediatly restored -

and the battery got its first good charge in weeks. Again, assuming that
you're not using a lot of the alternator capacity somewhere else, and that
the amp-hour rating of the battery is somewhere in the 80-100 AH area that's
typical for a group 24 or group 27 car battery, you should be able to
estimate the time to recharge the battery pretty easily - add about 50% to
100% to the time allowance to accomodate the tapering off effect and the
consumption of other loads. The recharge function will be more a function
of time than speed in most newer vehicles, because the alternators are
generally being spun faster than in older vehicles to keep the voltage up,
so that the need to draw from the battery under stop and go driving with
lots of loads online is reduced or eliminated. The result is that they
usually achieve full output at low speeds, rather than requiring the session
on the freeway that was more common in the good 'ole days.

The regulator may allow for an large inrush of current to feed the battery
for a small period of time, but a properly running charge circuit on a car
(with a good battery) should prevent a normal charge rate above C/10. Any
more would be detrimental to the battery. A partially discharged wet cell
can soak up a whopping amount of current for short periods of time, but if
you were to run 80 amps into an automotive battery for say 25 to 30
minutes, it would most likely gas out 'til the plates were exposed and then
the battery would probably explode or catch fire. My wimpy 12 amp charger
is enough to make car batteries "boil" within 15 or 20
minutes. Outgassing in normal when charging a wet cell, but if the
battery is making gurgling sounds you're charging it at too high a rate.

An underhood trickle charger is about 4"x5"x1.5" and many can mount right
to the battery in many cases. Or it can be remote mounted to the firewall
or any convenient location via 18 guage wire.

No unusual symptoms, but I'm sure it dosen't keep that up for long. The bat
voltage will rise, and then the voltage regulator will limit the charge, as
normal for lead acid.

Best I've seen is about 200mA full sun. That's not much, but it's better
than nothing.

OK...I think I have it going thanks to Byron! You all won't believe what the problem was...the TNC was set up properly. The GOS unit needed adjustment! According to Byron's instructions, I changed the nav format to Hddd mm.mmm, and this didn't work either. Then looking at how my location is formated in APRS+SA, I changed the format to Hddd.mmmm and the damn thing is working fine now. Haven't seen any docs on this "feature" yet...but look for KA2TLU-9 and that will be the unit in test mode at the house.

That makes no sense. Assuming NMEA 0183 2.x format, the lat/lon doesn't change format in the NMEA sentences. On Garmins the Datum DOES affect the NMEA data, but that's it (and that wouldn't affect whether or not the whole thing worked, it would have just shifted your position on the map a little bit). The nav format will only change what is displayed on the LCD, not the NMEA data.

Must have been something else. Gremlins maybe.

Ed, I use a device called an EMeter by Cruising Equipment on my solar setup. It is like a battery gas guage and measures a shunt inserted into the negative battery terminal. It gives readings of present battery voltage, charge or discharge amps, percent of capacity and a bunch of other stuff. It

can be ordered with an optional rs232 interface. Very usefull. The base
model is around $150 usd. There is another similar but larger one called the
TriMetric.

i got a lot of direct e mail today from hams that have the same problem with
the thd-7G

i went to the pc and reset all the tnc comands in packet mode to match the
printout i had on the thd7A

found gps text and ltext different   any how that did not change anything
to do with aprs.

i ran the thd7-g on winaprs and all works normal but the stand alond
thd7-g with or without a gps does not send out lat long or status message

i did find myself and n6bg via findu out in the atlantic ocean

i think byon is on a thd7g also. we are both at the same place

in local winaprs keep zooming in and look for yourself far east if you are
with thd7 g problems.

if anyone calls kenwood before i do let us all know what the scoop is.

73

steve las vegas

to find out how many hams have a problem like this, respond to this sig
with header message thd7g position problem

if you found a soluton let us know

find me on a map!   go to   http://map.findu.com/kd8s-7   works only
if i am sending my position out   and in satellite range

 They work out very well. You will see the difference in performance
even after a single day or a few days, the battery will be topped off
and will start just that much easier. The charge rate of these small
panels is small enough that there is little worry about overcharge. Plus
its only "on" for 6-12 hours per day. I have used it on a vehicle and
eeked an extra six months out of a marginal battery and then when I put
the new battery in left it in place. A guy here in town has a humongous
crew cab trck with 8 foot bed and dual batteries. He is set up for the
second battery only paralleled to the first if the engine is running. He
has a 20 watt flexible type solar panel mounted on his roof, wired
through a diode splitter that keeps them both topped off when the engine
is off.

I noticed this problem with 2.4.6. Dropping back in versions fixed it. I
think I went to 2.2.8. Also, it seems to be fixed in 2.4.7. 2.4.7 isn't on
the TAPR site, but the update is at
ftp://aprs.rutgers.edu/pub/hamradio/APRS/WinAPRS/

it was suggested to load a old version or winaprs and see if my position is
corrected with my thd7G i think i will do that tomorrow. if that works, i
means something in winaprs 246 is weird.

thanks for the suggestions

I carry one of the 'Battery Powered Jumpers', the plastic encased batteries
available from Sam's and other such places for about 50 dollars. IT WORKS!!!
There is now one available with 110v inverter for not much more. I also use
it as supplemental power on long events such as parades for my HT. I strap
it on the back of my ATV and don't worry about the amount of
transmissions...

The unit has been called into jumper service several times with quick starts
every time... We don't leave home without it...

Joe Dorn, W5VEX, Belton, Texas

That's 80 A into the battery, exclusive of the load. Measured. I didn't
think to measure the total output of the alternator, it wasn't what I was
looking for at the time.

>Most battery manufacturers recommend using a charger on a battery after it

I'd love to, but mechanical considerations make it difficult.
I've thought about solar panels too, but after that last hailstorm, I don't
think I'd go for that either...

I have the same sort of problem, but am NOT running a TH-D7A or D700A.
I'm running a TinyTrak.

The commonality here is that most of the people that end up in the
ocean are running MIC-E formatted packets. MIC-E allows 4 or 5
non-printable ASCII characters to be used in the longitude field
and some other fields (but not for the latitude). Any TNC or
computer that is filtering out control characters or the DEL character
will cause the position to be off. On an AEA TNC the "afilter" and
"mfilter" commands will filter some of these characters by default.

        afilter off
        mfilter 0

Will prevent the loss of these characters on an AEA TNC. If you're
using other TNC's, check for other commands that might be set
inappropriately.

Here are some of my packets after they have been expanded by various
APRS client software, to show you where the problem lies:

Tue Aug 15 07:41:07 2000
WE7U-12>APD213,RELAY*,WIDE5-4:@151343z4757.10N/12211.98Wj175/054/E>dsy/M1/Enroute...

Tue Aug 15 07:41:10 2000
WE7U-12>APRS,RELAY*,WIDE5-2:@151534z4757.10N/12211.96Wj175/054/Mic-E/M1/Enroute>

Tue Aug 15 07:42:07 2000
WE7U-12>APD213,RELAY*,WIDE5-4:@151344z4756.18N/02211.83Wj170/052/E>dsy/M1/Enroute...

Tue Aug 15 07:42:09 2000
WE7U-12>APRS,RELAY*,WIDE5-4:@151535z4756.16N/02211.81Wj170/052/Mic-E/M1/Enroute>

Tue Aug 15 07:42:10 2000
WE7U-12>APRS,N7IFJ-10*,WIDE5-1/1:@151437z4756.18N/02211.83Wj170/052/E>dsy/M1/Enroute...

Tue Aug 15 07:42:11 2000
WE7U-12>APRS,RELAY*,WIDE5-1:@151537z4756.16N/02211.81Wj170/052/Mic-E/M1/Enroute>
WE7U-12>APD214,RELAY*,WIDE5-1:!4756.18N/02211.83Wj170/052/Mic-E/M1/Enroute...

See the problem (latitude field)? This is most likely due to
either APRS client software doing an incorrect expansion of the
MIC-E packet, or due to one of the non-printable ASCII characters
getting dropped somewhere.

I already saw on one list (aprssig?) that the manual was available
on their site, and that it appeared to NOT have digipeat capability.
I haven't read it yet though.

Yes, it has a computer connector and a GPS connector. I heard a
price of around $330 with the TNC board installed. If they get
digipeat capability in there I'm going to be after one of them.

You're also supposed to be able to leave the GPS plugged in and
go between voice mode and APRS mode just fine.

I'm also interested in any experiences people have with them, but
I'm not sure they've hit the store shelves yet.

I finally had an opportunity to look at one yesterday. I will be doing a
review of the radio for 73 Magazine. No doubt there will be numerous
reviews over the next month or so. My first glance impression is that the
instruction set is very limited, and that the UIDigi command is not
implemented. I have not confirmed that to my satisfaction as of yet, so
stay tuned. I do know that the retail price will most likely fall to around
$300.00 due to competition among the various radio dealerships. This makes
it an attractive APRS tool when looking at the cost/benefits of the
alternatives.

More to come,

Rick Olsen, N6NR

Please check for WIDE5-5 & TRACE5-5 type operation (is that the UIDIGI
stuff?) as we use that here in the Northwest. Even if it doesn't
support that, I'll buy one anyway if it has "myalias relay" capability.
I have a need to digipeat low-power trackers through vehicles to get up
to the WIDE's.

Good luck on the review. Look forward to it. Can you keep us all
posted on any severe negatives, so we don't waste our money on the
early models?

Nope. For me it runs down quicker. Where can I get a battery as good as

yours? I'm serious, read on...

>I did not think this radio drew that much power, but evidently it does.

The specs in the manual will tell the story. I think that the HTX-242 draws about 1A on receive, but this figure depends on whether the squelch is closed or open, and if open what load is placed on the audio output. I don't know the input impedance on the D700, again check your specs.

Now do the math, using a figure of about 65 to 85 amp hours for a typical starter battery. Sounds to me like you may be getting your money's worth out of that battery! Fine business on that.

My experience with starter batteries is that they are really terrible when used as if they were deep discharge types. Take two batteries of the same size and weight (i.e., same amount of lead in them), one is a marine deep discharge style, the other is an automotive starter style. In my limited experience (I've only killed two starter batteries so far with my tracker), the deep discharge gives me about 2x to 3x as much energy as the starter battery before it quits.

To sum up, your battery is doing *very* well in spite of what you're subjecting it to. Do the battery a favor and recharge it via running the engine every day or two, lead-acid batteries die soon if they spend most of their time in a discharged state, even partially discharged.

But then the other question is why leave a tracker powered up if it's stationary and unattended for 1/2 a week at a time...

73,
Tony KD7TA

At the risk of starting the next great APRS SIG Thread, let me add a bit more to this discussion. If a starter battery doesn't get recharged on a 7 mile drive it's definitely time to get the charging system repaired or battery replaced.

Let's say you draw 600 amps for 2 seconds to start your car, that's 1200 amp-seconds or 0.33 amp-hour. If your alternator can produce the typical 50A or more, it should be recharged within 2 minutes assuming the battery isn't beat up.

In fact I monitor the recharge on my battery all the time, courtesy of the voltage readout on my Yaesu FT8100 mobile rig. Sure enough, the voltage drops from 14.8V down to 14.3V or less within 2 minutes, indicating that the charger circuitry is sensing that battery is topping off.

Finally, the 63 hours of running a D700 indicates that the battery *was* in excellent shape. It's not any more though, as discharging a starter battery that deep has damaged it, as well as being in a semi-discharged state for so long in the interim. Lead acid batteries like to be in a fully recharged state as much as possible, anything else is life-reducing.

My personal limit for unattended tracker use is now 24 hours, derived from my experience of a too-deep discharge happening within 48 hours. And that's with a brand new large battery. That need for a jump start happened because I thought that the previous battery, a 2-year old one, must have been wimpy when it died within 48 hours, so surely a new battery would last longer. Not!

Now I know the old one was just fine - until I worked it too hard that is.
Mea Culpa.

Is this wiring chart correct? I believe it is, but I guess folk here
will know (and others might find it a useful summary)
It calculates three types of null modem adaptor....
A-C, A-D and B-C

A	B		C	D
9	25		25	9
way	way		way	way
can	1	=	1	can
3	2	=	3	2
2	3	=	2	3
7	4	=	5	8
8	5	=	4	7
6	6+8	=	20	4
5	7	=	7	5
4	20	=	6+8	6

OK, my 2 cents worth. I have had the same situation. My solution was to
install a Ramsey ($5.00 kit) timer and a couple of relays. When the ignition
goes off, the KPC3 goes from every minute to every 15 minutes and after
3 hours the entire tracker (HTX-242, KPC-3+, Tripmate) shuts down. The
theory here
is that who cares where my truck is after 3 hours in the same place? If I
come back to the truck in less then 3 hours, the system is powered up
and ready to go. In the morning it may take a couple minutes for the GPS to
lock up, but that's a small price to pay for not needing to worry about the
battery and clogging up the network with unnecessary and redundant packets.
The system is fully automatic, but only works it the GPS will self start
and the TNC
will support the CLEAR statement in the GPSHEAD setting.

IMHO this solves a number of problems. I have a fully automatic tracker,
the network
isn't full of old position reports, my starter battery is safe, and I'm a
happy camper!

Try reading the whole post. My point was that a battery with more than a 15% depth of discharge will not be charged in 7 miles, especially if your charging system is operating properly. If you don't believe me, ask a battery manufacturer or speak to someone who actually designs charging systems for vehicles. ANY battery manufacturer will tell you that if you discharge a starter battery to a point where it will no longer crank the vehicle it should be put on a stationary charger (as soon a possible) until fully charged - because it will take several hours of driving to fully charge a battery. I actually used to work in the service department of the largest Nissan dealership in the country and sat through several tech classes taught by the factory engineers. Charging ANY battery over a rate of C/10 for more than a few minutes will seriously shorten it's life.

Furthermore, letting my LeBaron sit over the weekend to the point at which it would barely start and then driving it 7 miles, only to shut it off for 7-8 hours (used a company car during the day), with the DRAIN on the battery still there, assured that the battery was never getting fully charged. Think about it...

BTW, the LeBaron was fully scoped (on a $1200 battery/charging system analyzer) by a local shop that was very competent and specialized in electrical systems, and the car had a brand new alternator/regulator & battery. Their diagnosis: Too much load on the battery with the vehicle shut off and not enough driving. Same as mine. The problem started when I changed jobs; before, I had been driving 36 miles per day in the car just to get to work, and then usually driving another 4-10 miles during the work day. After changing jobs the car would barely get up to operating temperature before I got to work...

The car was now 12 years old, street tired, needed a new top, new interior, new suspension, the A/C had died, (it had new brakes and tires)... so for $400 I sold the car to a young woman who worked at a day-care center less than 2 miles from her house, and she had several problems with the car not starting, so I went and pulled the pager alarm from under the dash (which was drawing something like 325 ma with the car shut off). And I pulled the fuse from the main alarm (which had quit working) and it was drawing like 85 ma with the car shut off. The starting problems went away after that. I do not know why the pager alarm required that much current.

As a funny aside, she had the car for about a 16 months and stopped driving it because would no longer pass emissions. The car had something like 190,000 miles on it. The engine's number one cylinder valves were burned down to nubbins (based on the spark plug ashing), but the car still ran OK,

because the turbocharger was keeping the compression up. Mileage had
dropped to under 18 MPG.   She put a for-sale sign on it. Some guy came
out to look at the car, and she explained it drove but needed top-end
work. He popped the hood and took one look at the alternator (the spiffy
heavy duty one I'd put in less than two years before).   He told her he
didn't want the car, but would give her 100 bucks for the alternator.   She
told him he could have the alternator, but he'd have to take the car
too!   He gave her a couple hundred bucks and drove off... That was
1997.   Funny thing, a friend of mine SWEARS he saw the car driving a few
months ago, still plying the streets of Phoenix. :)

>As you all know I have been asking about the alternate >frequency for APRS. As it comes up I have
decided to go with >the regular frequency for the APRS to be able to track my >dog with pack on tromping
 through the forest.

After resetting my D7 last month, but before reentering the memory channels, I noticed one day that the
APRS traffic was sparse. There only seemed to be a couple of stations out there. I suddenly realized
that the frequency was 144.395, but APRS packets were coming in.
No, I don't remember the call signs, nor did I write tnem down. It was either some transmitter freq
drift from a digi, or it was a small group that hopped up .005 mhz for some private comms.... You know
who you are!

   and monitor my batty voltage to search for losses.
>>>3. Im gonna keep jumper cables behind my seat!

If all else fails, use the old CBer's trick for running linears while the vehicle is turned off: Run a
second battery in tandem, and for best results make them both Heavy Duty. You can get fancy autoswitches
 that isolate them so you can't draw both down to zilch, charge one at a time, etc.

Without a switch, this _may_ lead to starter problems down the line.
Starters and batteries are generally engineered as a system. Parallel
batteries can lead to the starter drawing too much current. Over time, this
can eat up brushes or the solenoid.

For a while, I had a decommissioned '69 Superior ambulance that was built
on a stretched Pontiac Bonneville chassis with the high output 428 pursuit
engine. Superior installed a second battery in parallel to handle all the
electrical loads, and I had the hardest time keeping starters in it. Now,
with the wisdom of age, I realize Superior may have put a beefier starter
in it originally, while I was putting in cheapo rebuilts that probably
couldn't handle the extra available current.

(and man, that baby could haul ass...)

I've been thinking along this line, because my future may hold a pair of GE
deltas in addition to the existing system.
What looks best to me so far, is an additional battery located at the
transmitter, with a small boost switcher, probably 5-10A output bypassed
with a 100A diode, and with a reversing switch (on the booster only!)

Without the booster, you have a simple isolated battery, which is charged
when the engine is running, through the monster diode.

With the booster, you have better control of the charge voltage, plus the
ability (with the reversing switch) to charge the vehicle battery from the
backup battery. It's not fast, but it's pretty safe. No large currents
running around.

If the booster fails, you're back to the battery and diode, so it's a
fail-workable system.

The usual "oh-shit" fuses inline, with spares.

This also keeps the radio battery from interacting with the starter, since
it can only supply a maximum of 5A additional current. In my car, this is
enough to start the car, starting from "click, click, click, bzzzzt" in
about 10 minutes.

I think it is possible for a tracker to avoid non-printable ASCII
characters in the longitude field, and it is even possible to avoid
them int the SP and DC fields. However, it is NOT possible to avoid
them in the SE field. There is no way to encode a 0 degree
heading (a common heading) without the use of the ASCII char
0x1C.

What do others think of having a tracker add 4 degrees to a
heading whose mod 100 is 0? So, if the GPS reports a heading of
100, the tracker would encode that as 104, 0 would become 4.
This would be introducing error to the data, but resolving these
dropped character problems.

Or, should trackers just not use the MIC-E Data format due to this
inherent problem? Would compressed data format be better,
assuming the trackers could handle it?

A friend of mine (ka2hsv) who has a gps 12 told me that he discovered why
his packets weren't showing up on aprs properly. He said that if you do the
"self-test" (whatever that is), that the Garmin resets its comm parms back
to garmin/garmin instead of nmea. If you have been doing resets, you might
check that.

144. [htaprs] Punishing a dead horse... AUTOMATIC POWER OFF - D700

From: "Bathgate, Ed" <Ed.Bathgate@marconi.com>
Date: Wed, 16 Aug 2000 09:41:22 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-102998-2000.08.16-08.47.43--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I set my APO on, and the radio ran overnight without turning its
self off. "Control, we have a bug."

Evidently Ron and Rob are not the only ones to have trouble with
the D-700 "APO" not turning its self off in APRS mode.

Is there a software fix? Can the TM-D-700 programming be changed
through the serial port, as a boot-strap download function, or
does it need to have a prom changed to update its brains?

Is kenwood keeping a "stuff to adjust" list?

Ed N3SDO

APO only works if no buttons are pushed by you, OR NO
signals heard on either band for the alloted time
specified in APO... As soon as a signal breaks squelch,
the APO function is reset..

Good luck

Robbie

> inherent problem? ....

If I could summarize this problem (hope I got it right). THere are 600
MicE's, thousands of Kenwoods and Pic-E's that all use the same format.
None of the APRS programs have problems decoding it. But there are 2
problems:

1) Improper set up TNC's for 8 bit.. The INITxxxx.TNC files included
   in APRSdos at least will always set up the TNC correctly. If someone's
   APRS software version is not properly setting up the TNC, then please
   contact that author and let him know....

2) RF packets gated to the INTERNET by APRS software that does not set up
   an 8 bit link. Same again. Contact your software author and ask him
   to fix it.

I think that represents the whole picture?

Bob

I think it is intentional that in APRS mode you dont want APO to shut off
your APRS tracker. Yet, if you only operate voice only and turn off
144.39 to save battery, then the APO will take over and work.

I'm sure it's normal 144.39 traffic. But since you are 5 kHz off freq,
you are only hearing the strong stations. I'm sure all the APRS
stations you were hearing were really on freq. 5 kHz off freq would not
give you any privacy.

I saw Bob's response, and he is absolutely correct that the client
and igate software should be corrected.

That said: I would be much happier in the interim with a TinyTrak
that would attempt to avoid the non-printable characters. I'm getting
a bit tired of driving in the atlantic ocean. The pacific would have
been much better (closer to home anyway, good joke Bill).

I looked at the compressed format for my HC11 tracker (YYYYXXXX
format), and it was a bit difficult to do on a lower-end processor.
The MIC-E protocol was much easier to implement and appeared to be
designed for low-end processors to do. If Byon can figure out how
to do compressed protocol with a PIC, more power to you. When I
last looked at it, it appeared that I needed floating point.

In my experiments I was getting more packets into the system each
time I managed to shorten my packets, so I went from '!' format to
MIC-E format, attempting and failing at compressed packets along the
way. It seems though that up to a third of my MIC-E packets have the
dropped-character problem, putting me in the Atlantic. Combine this
with most of the digi's expanding my packets back to normal size and
most of the advantages of MIC-E format dissapear.

I just want it fixed. Long-term the igates and client software need

to be fixed. It'd be nice if MIC-E format was left alone on RF (not
expanded) and even passed through the internet unchanged. Short-term
I'd like to see a TinyTrak that would do it's best to avoid the
non-printables. It's easy to re-program the chip later once the
rest of the system has been repaired.

Rendered body type: text/plain

If someone adept at Pic programming wants to. it is possible to have a PIC
with an input for the ignition and once the ignition is turned off, it sends
a message to the D700 over the serial port to select a different PM memory.
This PM could have a greater interval between transmissions. Also, when the
ignition was on, it could then select another one for the "normal" mode.

One other idea is to start a timer after the car is off and after some
interval, turn the radio off completely.

I chose the conversion constants so that you can let the least significant
Byte be always numerically 0 and then you can do it with single precision
16 bit integers. The result will still encode and decode to the nearest 80
feet or so (instead of 1 foot). It will always look like this:
"YYY!XXX!" since "!" is a zero in the LSB's. This is how I do it in
APRSdos, since no one will ever use APRSdos to the nearest foot anyway...
and it allowed me to use simpler code.

Hi all,

Sunday, 20 Aug I'll be leading several hundred motorcycle riders in a police escorted ride from North Oxford, MA to Amherst, MA. I'll have the D7 (with a Mirage BD35 amp and a Diamond 2m/440 ant) and GPS III+ on board the m/c, and hopefully will be able to get into some of the digis. I'd appreciate anyone who sees W1HO-7 letting me know.

We'll be leaving WalMart in North Oxford at 10:00 AM and the ride is about an hour and a half.

The purpose of the ride is to raise funds for the Pediatric Brain Tumor Foundation of the U.S. Last year we raised $61,000.00 on our ride, and we're looking to substantially increase that this year.

73,

Howard

Get kids involved in radio - buy them FRS's! Great for scouts, mall, beach,
boating, and hunting - the more you use them, the more you'll want. Keep a
pair in the truck for emergencies.

Sears has Coleman 14-channel FRS's on sale in Annapolis, perhaps your locale,
too, for $29/PAIR (no, don't think these have PL). I am NOT associated with
the store. Normally $79, $10 off, plus $40 rebate til the 17th.

I give pairs away as gifts as a wireless "intercom system" after modifying
one of them to take a wall wart for power. Have one in the kitchen, the
other is carried into the backyard/garage/hamshack.

Be careful about legalities. These are for voice-voice use only. Things I
have seen done, but are not allowed:
- packet demonstrations (note: FRS is 2.5kHz deviation)
- using an FRS pair to key the VOX of a remote ham rig
- telemetry
- SSTV (yup, it works)
- DTMF operation of devices

One bad thing is, it's hard to find an open channel at the mall, these days.

Rendered body type: text/plain

I'm just back from vacation in Idaho and Canada so here's my delayed $US.02
($CDN .03):
I have my d700's mounted under the front passenger seats in my Nissan
Pathfinder and under the drivers seat in a Toyota Sienna van. In the van,
there is empty floor space between the console and the dash in the center.
The control head is mounted on the top of a goose neck attached to the
floor in the center of the Sienna. In the Pathfinder, The control head is
mounted to an empty space below the CD player. In both cases, I took the
guts from the power supply for the gps unit (mounted in corner of dash),
put it in a project box to fit behind the head, and added a reset switch.
The only caution I would repeat here is to find out from the dealer where
the car's computer is. That (and space considerations) will determine
under which seat you will want to put the D700

Good Luck

73

The HTAPRS SIG has a few simple rules:

1) Stick to the subject. That means no virus alerts, no chocolate chip cookie recipes, no surplus gear fire sales, no nothing that isn't directly related to new APRS hardware.

Anxiously awaiting UPS delivery of my new Kenwood D7A(G) radio today. I have seen people talking of problems with the included antenna. Does anyone know if I'll
be able to make the trip to my nearest repeater 25 miles away with the stock antenna?

Thanks for any info.
Tim

Depends mostly on the repeater, but I doubt it.
The D7A antenna, for it's size, is the worst performing antenna I have seen.

A comet sma whip tripled my range. (9x gain)

I forgot. It works with my Garmin GPS 3P. Yes, I am in 'packet' mode
with the TH-D7A and yes I should be doing most everything correctly or
the Gramin wouldn't work. Just having trouble with the Tripmate. The
Tripmate and the Kenwood work well together in normal tracker mode
without PalmAPRS.

You do know that with the Tripmate, unless you make a modification to
it, needs to see the string "ASTRAL" sent to it to start sending out
GPS data, right? It needs this every time it is powered up. The
DeLorme software sends this string to it to get it going. I assume
some of the APRS client software does this as well.

One quick fix is to short pins 2/3 together for a few seconds when
you start it up (make sure you're not going to damage anything else
by doing this). The Tripmate sends the string "ASTRAL" out as
part of another string, and you can make it talk to itself to
initialize.

After that, it functions as a normal NMEA GPS receiver.

If you wanted to do it more properly, I suppose an adapter could
be made that wrapped the one pin back to the GPS, and didn't connect
the computer or TNC through to the gps input pin at all. Should work
well and always initialize.

Hey Tim,

I get to a reperater about 20 miles away. You can boost your power with 12V.
You can also consider a jpole antenna which is cheap and easy to make. I can
send you a link for this if you want?

Let us know your results. 73-Ron - KD5HTY

Yes, but offhand I don't know the model. About 20 inches long, flexy whip.

Sounds like the SMA-24. Seventeen inches long. I wouldn't say that it
has tripled my range, even on 2m, but it did allow me to work Mir.

I am able to get into a 440 repeater that is 40 miles away, not quite
line-of-sight, with the stock antenna. Sometimes using only 500mW.
But I'm full quieting with a 39 inch whip.

The original D7a would not work with a tripmate as the lon/lat
had extra decimal place in lon/lat. All units after 011-xxxxx
worked.

the tripmate needs a control line set hi to start as well as
seeing ASTRAL on the RS-232 input line.

Some RS-232 ports might loop back the data and you need not make a
special jumper.

Rendered body type: text/plain

High School Freshman 1st day at school is talking to his techno wiz friends and ask
them what did you do this summer we wrote virus softeware they replied and it has taken out the pentagon
 all major sourced of computers in the free world.

    So he ponders as they ask him what did you do oh i didnt cause that much hate and
discontent but the virus i sent out cause more damage than any other in the world antivirus software
will not detect it and it is traceable to the author, and it spreads like a case of the plauge. his
friends were in awe of his mighty talents and ask him for the code

So he sends them his code as a email

and it reads like this

subject this is a virus warning please forward to every one in your adress book

In the content section he posted the only way that you can get rid of me is put your system disk in your
 computers and type format c:\ when this is complete tpye fdisk
and delete every thing then you will be safe form me.

Well his freinds got the email thinking they were infected did as the instructions on the post stated .And it wasnt long before all the computers in town were down for the count why because people are like cow moo. The did what the email said and trashed there on machines.

Some thing to think about so please dont post any virus warnings here

172. [htaprs] Re: thd7G middle of atlantic

Rendered body type: text/plain

I have been having this problem since shortly after Dayton where my
THD-7A was upgraded. My observations are:

The radio gets the lat/long from the GPS and operates properly for
some time, from minutes to hours then it stops having updating your
position then it goes to lat/long 00.00/00.00. I have tried several
varaints of APRS+ but it doesn't change things.

If you change the THD-7A(G) back into beacon or internal APRS
mode it works just fine the position updates and is broadcast
properly. You can check this by pushing the position button
and displaying where your THD-7 thinks it is. This seems
to be a problem with the G model only I never experienced this
before the mod. It occurs to me that there are internal collisions
between the two I/O ports that are not being elegantly resolved
internal to the THD-7 and are being treated as loss of contact
with the GPS. It looks like it is going to take a firmware fix to
address this.

If anyone has a bright idea please post it. If developers need
any testing I would be glad to try and help.

well.....my upgraded thd7-g is now working fine.

its kd8s-14

i run the thd7g with a magellan meridian xl in the nema b mode.

i talked to kenwood when i tried everything to get it to send out posit
correct, then saturday i gave it one last try, and out of the blue its
working the way its suppose to work. i have no idea what i did

different......i did say "oh lord i hope i don't have to send my radio back
to kenwood"

as if some sort of magic it was healed.

i have been playing with my thd7 g and the kewood tmd700a all weekend and
its working good.

its nice to back in the deserts of las vegas instead of the middle of the
atlantic ocean.

whatever went on with the rig i am happy.

next time your radios crap out try a prayer.........i am sure it works

i got the nickle metal maha pb-39 for the kenwood thd7g

i have the bc-19 charger....

when i put the nickle metal into the charger its always flashing red on the
charger....

i have charged the battery on the wall wart.

anyone had any luck on chargeing the nickle metal pb-39 on the kenwood
bc-19 drop in charger?

did you end up buying the maha charger?

My Ed Yost NIMH charges just fine in the BC-19. It's over a year old.

I have been very happy so far with the tmd700.

there is more than enough bells and whistles to keep any ham busy for a long
time.

its always nice to be happy with a new radio where there are so many
choices out in radio land.

Kenwood support via the service department has always been good for me over
the the years that I have been a ham.

they have never let me down .

I always wonder how many phone calls Kenwood must get on any given Monday
about radio /operator problems.

most of the high end radios are not plug and play and you must read and
understand the operating manual and do some testing.

ham radio has been and will always be a technical hobby where you must put
time and effort into learning and understanding.

its sure a great way to eat up time!!

Subject: [YCCC] coming soon! and still FREE!

Coming soon to a computer near you... WinTelnetX 4.0!

This will include the most asked for feature of the last year! Yes, I
finally
got around to it! With this version you will be able to take a tnc,
radio, and
computer with internet connection, and make a local rf gateway to the
internet
spotting network. No expensive and hard to configure node software. No
databases to maintain. No user's to help out. no extra drivers to load.
Just a
simple gateway from a serial tnc to the internet. Use it to cover
remote areas
without enough users for their own node. Use it on an alternate
frequency to
reduce congestion. Replace 3rd party kiss mode tnc drivers with a
program that
can be started and stopped independent of your node software.

The only drawback... i only have kpc3+ tnc's here to test it with. I
expect it
will work with any single port kantronics tnc that supports the streamsw
mechanism for tracking input streams. But i would like some help
testing
it and figuring out what settings may be needed on other tnc's. If you
have
some time and want to help out with some early testing i will mail you
the
link to download the software for testing. If you have a dual port
kantronics tnc i would like to know how it handles switching ports and
streams. If you have other brand tnc's, how do they handle presenting
multiple incoming connection streams to the computer??

>The radio gets the lat/long from the GPS and operates properly for=20
>some time, from minutes to hours then it stops having updating your
>position then it goes to lat/long 00.00/00.00. I have tried several
>varaints of APRS+ but it doesn't change things.=20

To reiterate some experiences I posted before...

The GPS setting must be set to "NMEA" at power up, or you must power cycle it after you change from "not used" to "NMEA". Otherwise, the POS button shows 00 00.00/00 00.00 with flashing dots, and will beacon this location. When I take the HT into the house, and hook it up to my base antenna, I change from NMEA to Not Used and beacon the last position I locked into position-1 before removing the radio from the vehicle. So, when I put it back into the car, I always power cycle it one more time after I have everything hooked to it, and I never have problems with the GPS data flowing (as long as the radio and GPS have a commom power supply, see next...).

I am using the Rand McNally GPS, and when I power the GPS from a different power supply than the radio, the Radio will not read GPS data. This indicates that the Radio, serial ground and the GPS serial ground are not common to the power ground. However, I have checked this. I moved the GPS to a case that I could power it from 12 V in the car, cut the wires off etc. I specifically wired it for a common ground.

Jeff, John and group,

I live off grid and have for 12 years now. Your analysis was right on the money and I agree with most of what you said EXCEPT the part about sizing the array to recharge in one solar day ... I would be more likely to agree (though not be quite so generous 100 watts absolute max) if it were to be located on a remote mountain top snowed in 6 months a year. Depending on the site for specifics, I would go for a little more battery and a little less PV array. This also makes life easier on the solar controller not spending long hours needlessly dumping power and generating wasted heat (and most of it in the months where you do not need itor want it!). Also less boiling off of the electrolyte.

My general recommendation would be something like

- a pair of Trojan T-105s (6VDC @220AH) $170.00 (for both)
  or a Surrette T12-250 (12VDC@250AH) $240.00

- Siemens SP-75 (5 amps peak) photovoltaic panel - $400
  or Solarex MX-77 (5 amps peak) PV panel $450 (???)
  [in a harsh environ i.e. wind, hail, etc Solarex is THE choice]

- Trace C-8 solar controller $60

Plus a housing for the battery to keep it from freezing if its gonna be in a cold weather climate in winter. (buried and insulated would be best)

73 de brian

Findu has the wrong status for my tracker. I'm trying to replace the
bad status and not having any luck. I programmed a status into my D7
and let it beacon for a while. But the status is not being replaced be
what the D7 is sending. Is the status that the D7 sends out not really
a status? How do I get the D7 to send a status to replace the bogus
status on Findu?

Here's what the D7 is sending:

K9SA-9>APK001,K9MOT*,WIDE,WIDE:@211656z4211.31N/08804.85Wj000/000/Mic-E/M1/Enroute>Mon

Rendered body type: text/plain

On the issue of privacy: Is it possible to send a message to one person
only?   I was reading the mail and had a thought come to mind. We have had
instances in the past for the shelters for American Red Cross that have had
to have the message sent via phone so as not to broadcast the message and
embarrass the person for any reason. This would include the calling for
supplies that might be of a special nature for medical needs or the like.
Can anyone enlighten me?

On Sun, 20 Aug 2000, STEVE SCOTT LAS VEGAS wrote:

> its nice to back in the deserts of las vegas instead of the middle of the
> atlantic ocean.

Something else changed in the network somewhere:

I was getting correct latitude but quite a few incorrect longitude
positions into findu.com through last thursday. I changed my mobile
tracker to relay,trace5-5 mid-day friday to find out who was
modifying the packet (putting me into the Atlantic Ocean). Since I
went to trace mode though I haven't seen a single errant packet at
findu.com (not from my station anyway). Murphy's law I guess.

Someone may have just turned off a digipeater, home station, or igate
for the weekend, so the problem may reappear.

I'm running a TinyTrak, which runs MIC-E format like the MIC-E,
PIC-E, Kenwood D7A/D700A and others.

I'll run trace mode all this week to see if the problem comes back,
but it doesn't appear to be Kenwood-specific. If you're appearing at
0.00/0.00 though that could be a Kenwood-specific problem. In my
case someone was converting -121/-122 longitude to -021/-022, but the
latitude was still correct.

185. [htaprs] TH-D7/G Guidance

From: Bob Gormley <BGormley@INTELECTINC.COM>
Date: Tue, 22 Aug 2000 10:00:54 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-104222-2000.08.22-10.07.44--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Good morning HTAPRS list members,

        I'm requesting information about the new capabilities of the Kenwood
TH-D7/G.
        A little background first, I'm working on a balloon project in the
Dallas area to
        track the flight of a super pressure, manned, helium balloon. The
pilot and
        crew are all licensed amatuers. The next flight, distance and
duration, will
        take place in the next three to six weeks. Currently, we are using
three D7/G
        radios, one in the balloon and two in the chase vehicles. The
unresolved issues
        are,

        (1) The D7/G and Garmin III GPS in the balloon will transmit data to
the chase
        vehicles. How does altitude get reported? Will it show on Street
Atlas with the
        balloon position?

        (2) The two chase vehicles will have notebook pc's running APRS+SA
and Garmin
        GPS units. To track the balloon, the D7/G tnc will be placed in
"packet" mode to

communicate with with the pc. Can the D7/G be configured to transmit APRS while
in packet mode? This will allow the chase vehicles to track each other, plus the balloon.

All comments will be greatly appreciated.

Bob Gormley WA5YWC

APRS +SA has a box to check that allows the ALTITUDE to be displayed. I believe all of the recent Garmin units furnish this information. Just for fun, I have been following a couple of 18 wheelers as they criss-cross the country and I have seen the speed decrease as the altitude increased. You can also get altitude displays from the many digis on the mountain tops of New Mexico...

There were (is?) national defense restrictions that prohibited export of units that displayed higher altitudes, I believe 65.000 feet. Most manufacturers caused the GPS unit to stop functioning above that altitude.

Subject: [htaprs] TH-D7/G Guidance

Good morning HTAPRS list members,

I'm requesting information about the new capabilities of the Kenwood TH-D7/G.
A little background first, I'm working on a balloon project in the Dallas area to
track the flight of a super pressure, manned, helium balloon. The pilot and
crew are all licensed amatuers. The next flight, distance and duration, will
take place in the next three to six weeks. Currently, we are using three D7/G
radios, one in the balloon and two in the chase vehicles. The unresolved issues
are,

(1) The D7/G and Garmin III GPS in the balloon will transmit data to the chase
vehicles. How does altitude get reported? Will it show on Street Atlas with the
balloon position?

(2) The two chase vehicles will have notebook pc's running APRS+SA and Garmin
GPS units. To track the balloon, the D7/G tnc will be placed in "packet" mode to
communicate with with the pc. Can the D7/G be configured to transmit APRS while
in packet mode? This will allow the chase vehicles to track each other, plus the balloon.

All comments will be greatly appreciated.

Bob Gormley WA5YWC

In this SIG there sometimes was some discussion on remote keyboard ideas
for the D700/D7.

Maybe it is worth to follow this idea :
Sharp is selling $99-organizers named Wizard OZ-750. These small
organizers are equipped with full QWERTY-Keyboard and 40 Character
x8-Line-Display. A cable for serial PC-Communication (9K6,8N2) already
is included.

The Wizard not only can work with it's internally stored
Standard-Programs. It also is possible to run ready available or even
homemade programs written in Basic.
Among those available software there already is an
ANSI/VT100-Terminal-Emulation. This should be usable to control our
Kenwood-Radios and can be downloaded for free.

Until today this only is an idea, but after i have received my
organizer, i will start testing and report later.

The rule was 60,000 ft AND over Mock 1

So if the GPS programmers had a Fortran and not a Cobol background :-)
you are OK if you stay under Mock 1.

Best to check and you could get a small number of units without the altitude limit as a special order.

The balloon group is starting a new table of which units will work
over 60,000 Ft.

Tom Clark has posted much info on this to the Tapr APRSSIG and tacgps lists
(they both are searchable at www.tapr.org)   good key word is 60,000 or 60000

Rendered body type: text/plain

I have been using an old MFJ magmount for APRS with a D7.
It seems to take quite a robust signal to get a succesful packet decode.
Would anyone recommend an antenna that might be helpful that way, i.e., capturing a bit more signal.
What are some of you using????
Thanks in advance....
73 es Peace,
Stephen

Actually, there is no restriction on height display on a GPS receiver.
The
only restriction is that it not display if the height is over xx feet

AND
the speed is over yy MPH. (I don't know the exact xx and yy numbers)
I assume this to prevent their use on attack aircraft or missles. All
GPS
receivers I know of will work in a balloon since the speed is much below
the yy MPH limit.

Rendered body type: text/plain

Bob, there is the possibility of overcoming the Doppler effect by means
of a dedicated satellite and using 23 cm. for the uplink and 13 cm down.
The orbital parameters could rapidly be calculated through a HT
microprocessor and the VFO adjusted correspondingly. The yagi antennas
could be combined in similar fashion to the Arrow and adjustment made in
polarity according to the sig strength. I recall that the beam width with
the yagi is fairly wide at 23 cm but I will have to recheck for both
bands. According to my experience, beam width does not appear critical on
land for contacts of ~ 20 km. but a LEO is a different animal. You have a
good point but perhaps one that can be overcome in practice.

The 13 cm. yagi (known as the 'long John') is even more portable than the
23 cm unit. I have tried to interest Allan Lowe in building a dual band
prototype since their construction is fairly involved--close tolerances
and machine shop capability--that the project should be done
professionally.

Next we need a dual band HT (hopefully SSB) with a TNC for high speed
packet, perhaps as high as 200K bps. The 23 cm part of it is in hand,
albeit FM, but the 13 cm half should be doable considering the progress
in microwave component technology.

At any rate, my thoughts on the future.

CC'ed to the address that Kenwood Customer Care used to post to the SIG.

Think I may have discovered a bug in the Memory Control Program tonite. I
finished making my homemade D7-to-PC cable tonight and fired up MCP. I had
used it before with my GPS cable and a nullmodem adapter so i'm familiar
with the program. I was looking through the menus of data it retrieved from
the radio after performing a Read and noticed:

MSG GROUP:
ALL,QST,CQ,KWD

However, I have "*," included in my msg groups on the radio. A bug that MCP
missed that? Perhaps.. But I thought it was worth mentioning.

p.s. running MCP-D7G Beta Version 0.10 here, latest version available to my
knowledge.

Later!
Mike KE4YGT

The problem is not the antenna, but the station that you are listening
too. It does not have its packet TONES adjusted properly or its TNC is
over driving the mic-amp. A D7 will decode properly adjusted packets down
to only a single LCD S-unit... and even with NO s-units showing.

Problem is, that most packet signals on the air were never adjusted
properly. Transmitting PACKET is not plug-n-play.

Connecting a TNC to a radio requires 1) Adjusting TX Audio levels below
clipping in the transmitter, and maybe the addition of an R/C circuit to
either enhance or roll off the high tone so that the result is balanced.

Look on a scope and you will see some terrible packet signals

Unfortunately the fix requires the *other* guy to fix his signal...
:-(

Yes, I have never heard of anyone not able to make it work. I have been
using mine with my D700 for 9 months with no trouble at all. You will have
to add the "autostart" mod, and if you wish to power it externally you will
have come up with 5-6 volts or add some sort of voltage regulator. You will
also have to deal with the mini gps plug to DB-9.

Here are some links on the variations of modifying the tripmate, including
cramming the regulator into a D-Sub connector which I like this the best. I
run mine continuously so I decided to mount the regulator inside and heat
sink it to the metal case inside.

http://www.netrax.net/~bbarnhart/aprs/tripmate.html
http://www.execpc.com/~n9uur/tripmate.html
http://www.qsl.net/kd4rdb/tripmate.htm

Good luck, I'm sure if you have questions about setting this up there are
lots of folks willing to help you out here.

Dennis, N2LBT

BTW you might want to consider turning off your HTML in your email program.
Some folks with text based email readers find this offensive. See the link
below for assistance with this if using Microsoft Outlook.

Why won't the old versions still work? I know they are set to time out on certain dates, but how do they know the date? The system clock on the HPC? Why not set the clock back to a date when the timed out version you have worked and see what happens?

>i got the nickle metal maha pb-39 for the kenwood thd7g

>i have the bc-19 charger....

>when i put the nickle metal into the charger its always >flashing red on the charger....

The way I heard it, NiMH batteries damage drop in NiCad chargers if you leave them unmonitored... When I find it necessary to speed charge my PB-39 in my BC-19 I drop it in for only 10 minutes at a time, 10-20 off to allow the cell and charger to cool off, then repeat until the red light changes to green. At that point it is more or less a slow or trickle charge and is not taxing to the cell or the charger, if indeed there ever was any danger. The way I figure it, an ounce of prevention is better than a house full of smoke...

201. [htaprs] APRS/CE Update (New Build)

From: "Rob Wittner" <rmw@rwa-inc.com>
Date: Thu, 24 Aug 2000 09:20:43 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-104774-2000.08.24-08.28.28--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A new build of APRS/CE is available for download. Please check
http://www.tapr.org/~aprsce/ .

This is build 777, and it will expire on October 31, 2000.

A few "nuisance" or bug fixes have made it in this build, but not many. I
have devoted most of my APRS/CE energy to getting a native Pocket PC version
to work. (Hey, I have a new iPaq, and wanted a native version to play with
myself. ;-) Getting the code tweaked for Pocket PC (3.0), without breaking
2.0, 2.01, and 2.11 machines has been a challenge. The Pocket PC OS is nice
and stable, but sometimes you have to do a serious amount of mining in the
developer documentation to find what you are looking for.

The good thing about getting the Pocket PC conversion and build process
working correctly is that newer versions with more bug fixes and added
features will be able to be built in a relatively short amount of time. I
have eliminated the "unknown quantity" problems that are always present with
a new OS.

Please download this new version when you can, and let me know if I've
managed to break any of the existing platforms. (I wish I could own an
example of *every* platform, but my last name isn't Rockefeller. ;-)

Thanks for all of your positive feedback, continued interest and support.
It makes it all worthwhile!

Having had some time to play with my Cassiopeia E115 I can think of lots
of amateur radio uses - although APRS is a cool one. Thanks Rob.

Would there be any interest in a pocket pc ham radio group for
discussing pocket pcs, beta software etc away from the mainstream?

My Psion 3a/c has been very useful in lots of areas of the hobby - but
whereas the PocketPc is several orders of magnitude more powerful its
also a lot more difficult to write simple software utilities for it.

We need to share ideas I think?

>i got my tripmate all running and self starting what do i need to do to get
>it working with the ht

0. connect the GPS output to a comm programs and see if you are getting
   real NMEA data

1. Do the test outside so you know you have sat lock

2. might take 10 min plus to get a lock.

2.1 test with a voltmeter

3. Connect the ground o fthe tripmate to the ground of the d7a
   GPS port.

3.1 test with a voltmeter

4. Connectthe The NMEA data out for the Tripmate to the gps data in of the
   D7a (picture in the manual)

4.1 test with a voltmeter

6. read the d7a manual on the correct buttons to push to activate
   and select gps gps input.

Would help to know if you are doing a standalone setup or
using a computer. ie you have the D7a in APRS mode or PACKET mode.

See the www.Tap.orgr searchable sig mail archive if this help tag is taking
to long to get the answers you need.

Rendered body type: text/plain

FYI.

ICOM announced on Friday, August 25, that they have acquired Micrologic
(www.micrologic.com). These are the guys that developed the LoJack system!

As tremendous as the D7 and D700 products are (and Kenwood deserves a ton
of credit for being there FIRST), competition is the American way. I see
this as a double good whammie: We will have the Number One Big Boy waking
up and smelling the (APRS) coffee, and we will hopefully have an entirely
new plethora of software, I would guess fully integrated from the git-go.
If you check out micrologic's web site, you will see that they are real
pros when it comes to software applications, which is what we want!

Keep in mind that ICOM has made no announcements as to products---I am
speculating, and this is purely my opinion. But, come on now---ICOM's bread

and butter is the Ham market, not the commercial side. Two and two is
pretty easy to add up, especially as they see the success of the D7 and
D700 and they have nothing to respond with. Moreover, think of the leverage
they could now have with their display screen technology they have already
developed on their IC-2800 mobile, as well as their new portable scanner.
These would be great for displaying APRS icons, and the like.

Now, can they have a handheld, base and mobile, all with built in GPS and
integrated software, in time for Christmas 2000?!

210. [htaprs] Keyboard For D700?

From: "Larry Zanella" <larry.zanella@attws.com>
Date: Sun, 27 Aug 2000 22:39:43
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-105499-2000.08.27-22.46.30--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Late last Spring, there was a fair amount of posts here concerning the
possibilty of a keyboard for the D700.

Has any progress been made?

I saw a recent post here concerning a small handheld calculator assembly
that might be able to work. However, I thought the idea was a dedicated
keyboard, hopefully backlit, and attaching it to the serial input of the
radio. Perhaps a bigger display, also?

I have 3 D700s---one in each of my 2 vehicles, plus one in my den as my
APRS base. I'd buy 3 keyboards in a second. I suspect many Hams that use
the D700 have more than one, and would also love to have a keyboard.

Is there any way that TAPR could develop a keyboard for commercial sale?

How about a bigger dispaly that would be integrated with such a keyboard
that would be small enough to mount in a vehicle, yet allow a decent amount
of text to be read and keyed in?

Rendered body type: text/plain

Looks like you only made it about 5 miles. By the way, you're showing a
motorcycle icon. The D7 sends the wrong icon for a bicycle. To get the
real bicycle icon you have to select OTHERS /b.

I was out on my bike today too - k9sa-4

Rendered body type: text/plain

OK her is a probley simple question for the group, does the GPS have to be
plugged in to the D700? I have a product called the Road Writer
http://www.revolvedesign.com/producthome.html
<http://www.revolvedesign.com/producthome.html> and was just curious if the
GPS had to be run into the D700 or could I run it into the back of the road
Writer to have it work> If anyone has insight on this send me a mil off the
list.

Peter

It's alright to talk to yourself. It's even alright to answer yourself. It
only becomes a problem if you're talking to yourself and you go "Huh? What
did you say?"

Rendered body type: text/plain

hello,

I have a new Garmin GPS III plus, and I heard the rumour, that there is
a possibility to download maps for this device from the internet.
Does anyone know more about this?

Just a comment after some days of trying, the GPSIII plus is a very
nice unit, and its accuarcy is fascinating. But the built in maps are
really bad, at least in my region (Austria). That is why I would like
to make things with another map.

Werner:

For maps that cost money you can go to
http://www.garmin.com/cartography/mapSource/
and note that the GPS III+ will use the
Roads and Recreation CDs, not the Metro Guides.
If there are other sources than I am sure
interested too.

Alan   n4lbl

Rendered body type: text/plain

Notice:
September 1, 2000 is the last day to receive the special hotel room rate of
$89/night single or double and the pre-registration price for the
conference.

ARRL and TAPR 19th Annual
Digital Communications Conference
September 22-24, 2000 - Orlando, Florida

For more information see: http://www.tapr.org/dcc

Information
Mark your calendar and start making plans to attend the year's premier event
in digital communications. The 19th Annual ARRL and TAPR Digital
Communications Conference will be held September 22-24, 2000, in Orlando,
Florida - just minutes from the Orlando International
Airport.

The ARRL and TAPR Digital Communications Conference is an international
forum for radio amateurs in digital communications, networking, and related
technologies to meet, publish their work, and present new ideas and
techniques for discussion. Presenters and attendees will have the
opportunity to exchange ideas and learn about recent hardware and software
advances, theories, experimental results, and practical applications. The
Digital Communications Conference is not just for the digital expert, but
also for digitally oriented amateurs of all levels of experience.

A Conference for the Beginner as well
The conference is not just for the digital expert. As in years past an
entire session strand with beginning, intermediate, and advanced
presentations on selected topics in digital communications will be offered.
Some of the topics will include: APRS, Satellite Communications, TCP/IP,
Digital Radio, Spread Spectrum and other introductory topics. Come to the
conference and hear these topics presented by the experts!

Area Attractions
The Orlando Florida area is famous for its attractions and vacation spots.
Disney World, Universal Studios, and Sea World (just to name a few) are
within 15 minutes of the hotel. Shuttle service from the hotel will be
available for a small fee. Cape Canaveral and Cocoa Beach are a 30 minute
drive East of the hotel.

Symposia, Seminars and Banquet
Two symposia/seminars will be held which allow those with additional time
and interest to make the most of the Conference. For those who may have
interest in just one symposium or seminar, registration for the conference
is not required to attend these activities. This allows maximum flexibility
for those who may want to participate during the Digital Communications
Conference, but do not have an entire weekend to devote to the event.

The Fourth APRS National Symposium will be held on Friday and will be
moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely
include many APRS software authors, such as Bob Bruninga, WB4APR (the father
ofAPRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS
and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), Mike
Musick, N0QBF (developer of PocketAPRS), and other nationally known APRS
leaders. Join this group for the afternoon and evening for in-depth

discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

On Saturday night the DCC Banquet will be held. A guest speaker will speak after the banquet and a prize drawing will top the evening. The Grand Prize is a Palm VII Personal Digital Assistant and Synergy Systems LLC has donated two M12 development kits and many more.

The Sunday morning seminar will be focused on PIC development, design, and programming. This five-and-a-half hour seminar will focus on the things you need to know now in order to understand and begin to participate in PIC development.

Co-Hosts
The 2000 ARRL and TAPR Digital Communications Conference local co-hosts will be:
Lake Monroe Amateur Radio Society
(http://www.qsl.net/lmars/),
Orange County ARES/RACES
(http://evcom.net/~jvoisin/ares.htm),
Seminole County ARES/RACES
(http://wwww.geocities.com/capecanaveral/launchpad/4773),
and Orlando Amateur Radio Club
(http://www.oarc.org/).

International Co-Hosts PRUG (Packet Radio User Group of Japan) will be the International co-host for a third year running. PRUG will be hosting an informal social Friday evening before their seminar and symposium is held. Visit http://www.prug.or.jp for more information about PRUG.

Hotel
Conference presentations, meetings, and seminars will be held at the Orlando Airport Marriott. It is highly recommended that you book your room prior to arriving. A special DCC room rate of $89/single and $89/double per night has been blocked for 50 rooms and is available until September 1st, 2000. Once the 50 rooms have been reserved, room rates will increase. So be sure to book your rooms early! The hotel provides transportation to and from the Orlando International Airport. Please contact the hotel to arrange specific transportation needs.

Orlando Airport Marriott (conference hotel)
7499 Augusta Drive
Orlando, FL 32822
Phone 407-851-9000, Fax 407-857-6211
(http://marriotthotels.com/MCOAP/)

What you can expect at DCC 2000
- A full day of papers and breakouts for the beginner to the advanced
- Two seminars/symposiums
- The fifth annual Student Paper session.
- A banquet with Special Guest Speaker.
- Informal get-togethers throughout the weekend.
- TAPR Membership Meeting
- An event at which the most important new developments in amateur digital communications are announced.
- Digital 'movers and shakers' from all over the world in attendance.

There are few activities where your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! A get-together with colleagues and bringing each other up to date on your latest work -- all this, and more, for an unforgettable weekend of amateur radio and digital communications. We hope to see you at the ARRL and TAPR Digital Communications Conference on September 22-24, 2000!

Full information on the conference and hotel information can be obtained by contacting:

Tucson Amateur Packet Radio
Phone: (940) 383-0000.
Fax: (940) 566-2544
Email: tapr@tapr.org
Web: http://www.tapr.org

Registration Form
Contact the TAPR office by Phone 940-383-0000, Fax 940-566-2544, or Internet: http://www.tapr.org and tapr@tapr.org to register or for additional information.

Conference Registration includes: Conference Proceedings, Sessions,
Meetings, and Lunch on Saturday.

- Pre-Registration (before Sept 1st)

$45.00 _____

- Registration (after Sept 1) or at door

$55.00 _____

- Saturday Evening Dinner (Limited Space)
Dinner with Guest Speaker
Prize Drawing

$30.00 _____

Symposia/Seminars

- 4th Annual APRS National Symposium
Friday, 1pm - 7pm. $25.00 _____

- Sunday Seminar
PIC Design, Development, and Programming

Sunday, 8:30 am - 2 pm. $20.00 _____

I am playing with the radio and have hooked up my sharps hc4100 to the data
jack and it works fine 2nd i have a tripmate that has the mods done to self
start and it is sending out it requierd information it works with aprs ce
and my posit shows up on my map.
Now for the problem when i hook up the tripmate to the radio and tell the
software to get data from tnc it will not get any the adapter i have made
up using ground and tip it is only a 2 wire plug 2.5 mm is it possible that
i have the adapter wired wrong or wrong plug it is not shorting out or is
the receive data line the second pin on the stero plug any body got any
ideas i am bout out of them

 there are only 2 wires (other than ground) and the transmit wire on
 BOTH units is the one that wags the voltmeter.

Just don't connect two wiggly wires together.

Dr Werner,
There is a program called Mapsource which you can purchase and with it
you can upload maps to your GPS. There are at least two CDs available
now, one is the US Road and Recreation, and the other is the world. I
have both, and the one for the US is fairly comprehensive, and the one
for the world, which is just major roads. Both CDs are available from
Garmin.

hi John,

thank you for reply,
the Garmin Maps I knew already. But they are very expensive and for the
region I live I need 3 map CD's to cover a square of 50km.
They sell the CD for each country separately and thats not very nice
for me.
If I could get a map for whole Europe on a CD like you for the US, I
would probably buy it, but thats not the case. Imagine you would have
to buy a CD for each federal state in the U.S.
My impression is that they try to make money with bad maps in the
Garmin and good ones they sell at a high price.

73!

Garmin 12XL Accuracy Report - Post SA
Last updated on August 3, 2000 comments to John Bonde
With the elimination of the largest single error source from the GPS system civilian
users have seen a dramatic increase in accuracy from their receivers. Just how
accurate can a receiver costing less than $200 US be? Of course, the answer is
"It depends". Assuming a clear view of the sky atmospheric errors will tend to cause
the biggest problems. Complicating matters are that not all areas of the earth are
affected equally and that relatively rare events may cause large errors.

224. [htaprs] APRS/CE Build 806 Available

From: "Rob Wittner" <rmw@rwa-inc.com>
Date: Wed, 30 Aug 2000 14:06:40 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-106397-2000.08.30-13.14.27--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRS/CE Build 806 is available! Please check http://www.tapr.org/~aprsce/ .

This fixes a few minor Pocket PC issues:

 - The toolbar background now repaints correctly,
   eliminating BitBlt "droppings" on the unused
   portion of the bar.
 - The splash dialog now has a border around it
   so it's visible on top of the startup map.
   It also provides instructions to "Tap here
   to close this window"
 - Probably the most helpful change, and the
   whole reason I released this, is that the
   status bar has been re-added to the Pocket PC
   version. This will help to get serial connections
   debugged, as you can now watch the serial
   (and/or network) traffic on the bottom
   of your screen.

Build 777 is still available, in case there are problems with 806.

Please download and let me know your successes and/or trials.

Thanks,

   -Rob
    KZ5RW

The Tripmate can take 15 mins to get a valid sat lock (outside)
might never get a lock inside. If the NMEA fix is not valid the D7A won't use it
even if there is NMEA flowing.

I would find some one with a d7a/d700 GPS setup and plug it into your D7a

or as suggested several time look at the NMEA data on a computer communications program
and send us a 25 line sample.   a V in the data streen is invalid data and a A
is valid remember A OK

you never said if this is a standalone set up or you are running the d7a into a computer.

just cause data is comming out of the tripmate doesn't mean the d7a can use it.

The Palm Sat Tracker called PocketSat is only $12.50 US and you
can get it online from www.palmgear.com

I use the Palm IIIc (color) unit and the display can be set to red
for night mode as you watch outside.

PLUS the unit can dial up to get the new keps. using a Free program
called getTLE. (need a modem and hot-sync cable)

Use the Seatch function on the palmgear site to find the software.

Do you hear beeps from the D7G? is Menu 2-2 set to GPS UNIT - NMEA? The
radio should send low tone beeps about every 10 seconds if it is receiving
data at all, then bleep three high tones when it receives the first good
posit from the GPS.

Maybe check to see that you have the two data lines between the radio and
GPS wired right. I got mine backwards the first time. Reversed 2 and 3, bam!
:-)

Mike KE4YGT (Don't use that radio for target practice, send it to me
instead, I can use a spare D7)

It is a MARVELOUS program. I downloaded it last week and registered it the
same day, once I saw how well it worked both on an LCD Palm IIIx and Palm
IIIc color. One caveat, it does not track elliptical orbit birds like AO-10
or upcoming Phase IIId. It is for LEO birds only (like all the pacsats and
ones we use with aprs as well as MIR and ISS). I have been in touch with the
author and he has expressed some interest in putting out a version that will
work with the elliptical orbit birds. I would think if we sent him a bunch
of messages indicating our interest, we could get him to do it.

The URL for info about the program is:

http://emmgraphics.com/pilot/pocketsatinfo.html

You can order/download it from Palmgear site. I think you can download the
trial version from the web site noted above.

Mike brought up a good point about the two data lines between the radio
and GPS. Since I'm new on the D7G and GPS scene, do you need both tx and
rcv data lines connected between the D7G and GPS. I'm using a Garmin GPSIII
with only tx (from GPS) to rcv on D7G connected. Does the radio have to
respond back to the Garmin to function properly?

Bob WA5YWC Plano, TX

234. [htaprs] APRS Protocol Specification Version 1.0

From: John Ackermann <jra@febo.com>
Date: Thu, 31 Aug 2000 10:56:39 -0300
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-106721-2000.08.31-10.04.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm happy (you don't know *how* happy) to announce that APRS Protocol
Specification Version 1.0 was approved by the APRS Working Group on
August 29, 2000 and has been made available for download at the Working
Group web page, http://www.tapr.org/tapr/html/Faprswg.html.

This Version 1.0 (technically, due to change control, version 1.0.1)
document is nearly 130 pages long and does a tremendous job documenting
the APRS protocol as used on the air in the summer of 2000. We should
all thank the Working Group members, and especially Ian Wade, G3NRW, the
Technical Editor who actually wrote the thing, for their hard work.
Although the process took far longer than anyone anticipated when we
started, I think the end result is definitely worth the wait.

Where do we go from here? Although this is an excellent document, it
almost certainly still contains errors, omissions, and ambiguities. In
addition, it reflects only the current protocol, and not any of the areas
in which the protocol might be extended. The WG members will be meeting
at the DCC in Orlando next month and electronically thereafter to put in
place a mechanism to deal with requested corrections and enhancements.
The WG Charter outlines a way to handle this, but experience has shown that
some modifications may be necessary for a workable process.

Also at the DCC and thereafter, the WG will consider adding new members.
Since its founding, several new authors have come on the scene, and two
of the original members have resigned. Any author of software or firmware
implementing the APRS protocol who wishes to join the WG should contact
me (jra@febo.com or n8ur@tapr.org) directly. Please -- we need to hear
directly from those interested in joining, so rather than writing to ask
that someone be considered, encourage that person to get in touch with me.
Also, please remember that the WG is not affiliated with TAPR. Membership
decisions will be made by the group, and I can't tell you now how many (if
any) new members will be added.

73,
John Ackermann   N8UR
Administrative Chair, APRS Working Group
jra@febo.com

>
> Bob WA5YWC Plano, TX

You don't need both data lines connected to operate the D7 as a
tracker........HOWEVER, if you do have both data lines connected then you get to
take advantage of a "little used" feature of the D7 radio.

The D7 will automatically convert APRS position packets to the Garmin waypoint
format (GPWPL I believe its called). Anyways, if a person has their Garmin GPS
(II,II+,III,III+) interface setup in NMEA/NMEA mode for bi-directional
communication with the radio.....the D7 will plot APRS stations on the moving
map display of the GPS!!!! PRetty neat if you don't have a laptop or palmtop
computer available.......however, this will add each station to your waypoint
list......which can be very troublesome when you have to delete them! <grin>

Cheers,
Tino/VE6SZR
Calgary, Alberta

Rendered body type: text/plain

Believe that I may have stumbled across the cure for the weird clock operation in the D700A.
On pg 12 of the Specialized Comm. manual, at the bottom of the 2nd column is a note about resetting the clock IC. Performed the reset yesterday morning and since then the clock has kept proper time over a 24 hr period, including the rollover at midnight and a shutdown for several hours.

The directions seem to imply that the reset is done after the unit is turned on, but I didn't get any results that way. However, if I held the middle two (third & fourth) buttons down when I turned the unit on it reset the internal time and date to 0's. The middle two buttons are the REV & LOW buttons under the usual button assignment. If you have changed the button mode as I have these two buttons will be labeled P.MON & BCON when the radio is turned on.

Of course you'll have to set the proper time & date either thru the controls or with the GPS time set function under "POSITION" when you have a good GPS signal.

Now if only we could have used those extra hours that the units were putting in a day Kenwood would have a real money maker. Also note that the clock chip is only good thru 2098. You younger fellows may end up with a useless radio after then. ;-).

1. [htaprs] TH-D7A(G) PROBLEM

From: "Pedro Perez Alvarez-C." <eb4dka@teleline.es>
Date: Sat, 2 Sep 2000 5:17:24
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-107057-2000.09.02-05.24.51--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi friends,
I have a little problem. When I put my D7A(G) in VHF in the B band working
APRS, the TX voltmeter does not work in this band when I transmit a beacon
or a message (the TX voltmeter is shown in the A band while I am
transmiting VHF APRS in the B band). In RX the s-meter works fine, and in
voice mode both TX voltmeter and RX s-meter also work (VHF B band).
Is this correct?
Pedro, EB4DKA

Message-ID: <LYR845-107061-2000.09.02-06.20.10--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just got one this week too. It appears that the S-meter/Battery meter
functions only display the selected band for voice operation. This appears
to be by design.

By the way, I am using the TH-D7A(G) with a Garmin eTrex and have a great
time (I did replace the antenna for better performance on 2m). Today I
leave for Munich, Germany and will take them with me. The programmable
offset feature (not documented) is great for international travel. Look for
reports from AE5PL-7 this week from Germany and Switzerland.

I don't see the benefit of starting more D7(G) lists. It seems to me that it
would be more practical to keep the discussions here. Otherwise we have to
keep up with two separate lists, as well as crossposting, etc. AGGGHHH!

Just my .02$

Walter

Rendered body type: text/plain

Which way this goes is okay by me but here is a message I just sent and go
returned because I had not subscribed yet.

Maybe my message is better posted here.

Here is the message:
I just got my th7g, downloaded the software from the Kenwood site, plugged
the radio in and could not get the software to see my radio to read/write to
it.

I get a time out message. One person said he is on COM1 and I am on COM2.
Hope that is right. I know I had a program for reading cards that gave all
options for the COM1 through 4 but would only work on COM1. Hope that is
not the case here.
The program I downloaded (MCP-D7G) has no help and I commented to the
address where I downloaded the program that it is missing.
The instruction manual that comes with the radio is for the TH-D7A showing a
"D" after all the frequencies in the manual. The Enhanced features manual
(APRS mainly) would in deed have the "D" behind the frequencies because the
TNC and/or Packet indicator is on the display. I think the "D" goes away
when you have the TNC off (I say this because I did a Full Rest of the
radio because the error I was getting from the software program).
So could someone walk me though the areas where I might be fowling up?
Thank you for the help. Bottom line is how do I shake hands between the
MCP-D7G and radio?
Thank you for any help.
Jerry DE N7YGE

Jerry,

I have no trouble with the interface.. I would suggest,
that you some how insure you are using COM1 on the
pc/laptop... Then insure you are using 9600,n,8,1 for
the parameters of the port.. This done, then if the D7G
and pc don't talk to each other, reverse the data
lines. The reversing of the data lines has always been
the main reason the communication has not worked first
time..

73! es good luck

one old computer port trick is to jumper The RS-232 pins 2 and 3 together
and run a comm program. With the pins jumped any key you type
on the key board will echo and NOT echo if the jumper is removed.

Hi Doug,

I found some at Mouser Electronics www.mouser.com

Try part # 172-2010. When I ordered some months ago they were $3.30 each.
They are a right angle plug and considerable more robust than the stock
Kenwood plug. I got excellent service from Mouser. They will also send you
a nice CD catalog.

I used a 3/32" right angle, gold plated stereo plug from Radio shack. 2.5mm
= 1/10" = 3/30" ... close enough for me, no problems in PC or GPS port.

Radio Shack P.N. 274-(0)298, $1.99 (Zero on the receipt, but not the card,
go figure)

Mike KE4YGT

That's correct Scott. It wouldn't be in the "manual" if
you are refering to Kenwood's manual. It also is not in
the documentation for aprs. I feel it surely is in the
aprssig archives tho..
Make sure you leave a space after the email address in
the body of the message..

Good luck

I have had trouble with my 3/32" plug: slightly too small to make solid
contact. I have to hold it to one side to make it work.

i am confused as to what you are in reference to do i know you .
my my internet connection is of no concern of yours.
i have several isp depending on where iam at the time also
would you like a list of the other groups that i moderate
if you need have the need to find my location go to findu.com
and look up my kb9lnc and kb9lnc-3 they are located in southern indiana
if you have a problem with me email me direct at bdevine@charter.net
and we will discuss it.

Please answer your personal e-mails elsewhere. This way you will not waste
all our time with messages that have nothing to do with APRS. Remember,
there are hundreds of people on this list that probably didn't sign up to
read this sort of thing. Remember this IS an HT-APRS special interest group.

Thanks,

Walter

Hey Byron and all,

I will not appollogise for making sure there is no
foul play against a fellow ham, considering it has
happened on this sig several times. (It even happend
to you last year You might read the archives from
others, they are available on the tapr sig.)
FURTHERMORE,I would expect the same in return. and
would not be offended in any way. If ANYBODY on this
sig has a problem with this, PLEASE EMAIL me direct.
I will gladly discuss it with you.

Lee/KD4TQZ

20. [htaprs] ADMIN: Monthly Announcement

From: "Horzepa, Stan" <Stan_Horzepa@adc.com>
Date: Tue, 5 Sep 2000 13:00:33 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-107743-2000.09.05-13.09.55--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

(This message is posted on the HTAPRS SIG on a monthly basis.)

PURPOSE

The purpose of the HTAPRS SIG is to provide a forum for folks interested in
discussing the new, hot technologies related to APRS (for example, the
APRS-ready radios from Kenwood.)

POSTING MESSAGES

To post messages to the HTAPRS SIG, send email to htaprs@tapr.org

HTAPRS SIG RULES

The HTAPRS SIG has a few simple rules:

. Be courteous. Abusive, insulting, or rude behavior demonstrated towards
another list member is a violation of this rule.

. Stick to the subject, i.e., hot technologies related to APRS. Subjects
that are only tangentially related to hot technologies related to APRS (like
"what kind of car should I buy for my new Kenwood transceiver?") may be
considered off-topic. If you start a message with "this is off-topic..."
then you are violating this rule.

. Be succinct when composing a message. (The HTAPRS SIG software has been
optioned to limit the length of each message.)

. When quoting a previous message, only quote the parts of that message you
are referencing. (The HTAPRS SIG software has been optioned to limit the
length of a quote.)

. Do not send messages in HTML format.

. Do not send attachments.

. Cross-posting is not permitted. (The HTAPRS SIG software has been
optioned to prevent cross-posting.)

. The HTAPRS SIG administrator reserves the right to suspend or ban any
list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the HTAPRS SIG, follow the directions you will find at
the bottom of each message you receive from the HTAPRS SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the HTAPRS SIG, please
email the HTAPRS SIG administrator at the address below.

Rendered body type: text/plain

I am trying to find a power and data cable for the Etrex Garmin GPS. I called to Garmin's 800# and they do not make a Data & Power cable yet. I need to have one wire with all four conductors active for a permanent installation. Do any of you know of any after market connectors for the new line of Garmin products?

Cable looks like this but should have all four wires...

Garmin does produce a data/power cable for the eTrex/eMap line with a cigarette-lighter plug on the end. I bought mine at HRO in Sunnyvale about 2 weeks ago. For permanent install you can just cut off the lighter adapter end. Make sure your wallet was prepared as it cost me $52.

Rendered body type: text/plain

Hello all,

I am a new ham just getting into the hobby. Having a ball playing with my new Kenwood TH-D7A(G) HT and APRS. Would like to get some recommendations for a magnetic mount mobile antenna for doing APRS with the HT. Have purchased
a 30 watt amp to play around with. Any suggestions?

Thx in advance
Tim K5TLG

Hi Tim, et. al.!

Good luck with the TH-D7A -- I hope you are having as much fun as I am!

As you have discovered, I am sure, the standard rubber duck is terrible on 2m (seems to work better on 70cm). I was using an old MFJ dual-band mag mount antenna and found it to be a bit spotty. I recently got a Larsen NMO 2/70B with the mag mount and am very pleased! The whip is one solid piece with a coil wound in it (as opposed to having a trap with lots of set screws to hold it in place and in tune). The mag mount has a run of RG58 with an ingenius connector that allows you to put either an SMA or a BNC connector on it without the need for an adapter. I was always afraid of snapping off the SMA connector on the D7 with a BNC/SMA adapter connected to coax -- the Larsen is much more lightweight and mechanically stable.

Again, I am very pleased with it. It works well on 2m APRS and on the local 70cm repeaters.

Peace and 73,
Stephen
KD3OG

Hi Stan,

Boy, I don't envy your list management job, but thanks for doing it. I
appreciate it very much.

In case you missed it, I made a suggestion to roll the HT list back into
the main APRS list.
Reason: most of the current HT discussion is about the D7 and D700 and
CE/Palm, which are now becoming mainstream, i.e. no longer "HOT".

If you think back to when you formed the HT list many months ago, I think
you did it because there were complaints about "Hot Technology" threads
taking up too much bandwidth on the main list -- exactly the same type of
stuff that was occuring with the PRIVACY thread of two weeks ago. For HT
you formed a new list; for PRIVACY (and other protocol issues) you didn't.

It just seems we should be consistent. No?

Do you see any reason to continue the HT list?

And if you say "continue it", I would ask "How does one decide when
something is no longer hot and belongs on the other list"? I already see a
lot of cross posting because of that -- another big complaint.

So I vote to fold the HT list back into the main list.

73 and thanks again,

Ralph, KC2RLM
Chatham NJ

Bob wrote:

>THe HT list is for everyone who bought a D7 or D700. HOT was just a
>rename to expand the original HT to cover the D700. It covers no other
>"hot" technology.

But other technologies are discussed, e.g. palm/CE devices. Also, by
definition, "the purpose of the HTAPRS SIG is to provide a forum for folks
interested in discussing the new, hot technologies related to APRS (for
example, the APRS-ready radios from Kenwood.)"

... but not limited to Kenwoods.

>It should remain separate for those that want to share ideas about the D7
>and D700 but that do not want to subscribe to the QRM on APRSSIG.

One side of me agrees with this - a lot. (I voted to move the QRM to its
own list.)

The other says this is inconsistent with "the vote" to have one list. One
problem is that cross-posting is necessary, e.g. APRS on satellites. Also
this second list might be overlooked by an APRS beginner who's looking for
info on these rigs.

And when do we take the D7 and D700 off the HT list and put it back on the
main list?

Just some other perspectives.

73,

Ralph

 The point is that many people are still just acquiring the D7/D700 and
we no have the Alinco DR-135 as well. This is the logical place for
inquiry about these radios.

Ok, this is me. I just recently bought a D700 and have had a D7 for
several months. I just joined this list about a week ago. I joined the
list hoping to hear some info about my radios. I've been running APRS with
the D7 since I got it. It was actually my very first radio....I just got
my license back in June.

Anyway, I say keep the list. As new radio's come out with built in APRS,
they will need a forum to talk about them and when people buy theses
radio's with these cool features they don't know how to use, they will have
to go somewhere to ask.

One more question, which list is considered the "main list".

Just my 2 cents.

Rendered body type: text/plain

Hello everyone, in my last post I had mentioned that I just picked up a
D700 and have been using a D7 for several months. Well I have a couple
questions.

1. The GPS cable that comes with the radios (both of em) seems kind of
weak. With my limited electronics experience I decided to have my friend
wire the cable from my GPS to the wire for the radio. He complained for
quite a while about how hard the wire is to work with. (Let's just say he
said words I would *never* say on the air.) The wires that came with the
radios were too fine. He kept breaking them or cutting through it trying
to strip them. He suggested I go to Radio Shack and pick up a wire with
the same plug on the end and use that. Some thing that is a lower
gauge. For one it would be stronger and two, easier to work with. Has
anyone experienced these same difficulties?

2. Does anyone know a supplier that has ready-made cable to hook up a
Garmin GPS III Plus and a D7 or D700?

Thanks for your help.

73's

Marc Smith - KC8ORT

GPS cable. I was unable to get solder to stick to the wire
that was supplied by kenwood with the radio. I made my own connection
cable with a radshack jack.

I recently inherited a 486 laptop, and was unable to get any
data in or out of the d700 when in APRS mode. It would work ok
in TNC mode though. I was hoping to be able to monitor the data
going to/from the aprs-tnc, like what you can do with the pmon
screen. I guess I could run an APRS program on the laptop, but
that would disconnect my GPS, which is wired to the D700.

Anybody got a workaround?

Actually, I think it is time to bite the bullet and rename the HTAPRS list to APRSRADIOS. That was always the intention of the list, so that users could share notes on the D7,D700 and now the Alinco without having to subscribe to APRSSIG.

Other "hot" technolgy new items for APRS should be introduced on the APRSSIG where everything diserves to see the light of day... If it is unique to handheld or mobile/portable, then it would seem appropriate for the APRSRADIOS list.

Stan?

I noticed the same thing. I was able to strip the insulation, but the wire
has some kind of plastic/glass fibers run with it, presumably for strength
(i've seen it in other types of "stereo headphone" cords) .. Finally I got
enough solder on the wire to connect it to the molex pins of my Pfranc.com
ePlug. Having tinned the wire side of the pins helped somewhat.

Marc asked if there are other sources for more substantial
"add-your-own-end" GPS/PC cables that could be used in lieu of the thin
Kenwood-supplied cable.

Ed, KG4ALG, posted the following sometime ago. They Mouser cables worked
for me. I got the GPS four pin socket from Blue Hills (I believe someone
already posted their URL). Even so, I found rolling-your-own GPS cable very
difficult. The socket is hard to work with. You might want to conside a
pre-built from Blue Hills or others.

Ralph, KC2RLM

"If you're willing to be a little more patient, raw plugs and molded
cable/plug assemblies are available from Mouser Electronics for $2-3. Here
is a list of options (courtesy of N0OTM Joe LaGreek):

  Black stereo plug, shielded cable $2.97
172-2304 Grey stereo plug, shielded cable $2.97
172-2010 Black stereo 90 deg plug shielded cable $3.96 (over 1000 in stock)
Plugs
172-3305 Hi-Rel Black plastic unshielded $2.51
172-3306 Hi-Rel Spring strain relief, shielded $2.80
172-3405 Black Plastic and solder terminal $1.24
172-3406 Shielded handle with spring strain relief and solder terminals $1.79
172-3307 Gold contact with black metal handle, shielded $4.80

Phone 800-346-6873 or http://www.mouser.com/

Enter a part number in the search area to get a screen with pricing and
availability. That screen will let you view the part in a a .pdf of the
catalog page.

This is correct.

" It would work ok
in TNC mode though. "

Mine too.

  "I was hoping to be able to monitor the data
going to/from the aprs-tnc, like what you can do with the pmon
screen. I guess I could run an APRS program on the laptop, but
that would disconnect my GPS, which is wired to the D700."

Actually, no. The APRS programs know how to send a control E (sometimes
referred as "pico control E mode" to the D700, causing it to send the GPS
data back up the serial port to the laptop. Thus you only need a single
serial port laptop to go mobile with.

I found the best cable to use for the Garmen plugs is computer cable
such as printer cable etc. use four of the x wires. The outer insulation
is large enough to be held in the plug when reassembled. I striped the
outer shield back a couple of inches, trimmed off all but four wires and
fed them through the backing piece. soldered the tips on, slipped them
into the "plug and put it together. Trying to get four individual wires
into the plug didn't work as you found. (I wanted power and signal.)
I attached the appropriate wires to the power source wires and radio
input external to the plugs and it has worked quite well. A little
shrink tube and I was in good shape.

Run APRSdos with the radio in PACKET mode and it will do everything,
including seeing your own GPS data.

Or connect it to monitor the GPS port instead of the serial port. It will
display all posits from other stations just like a GPS will.

Just found out the hard way that kenwood must want more than pins 2 3 and 5.
The manual shows pins 2-8
Anyone know EXACTLY which additional pins are needed for a minimal working
cable?
I'd be surprised if they actually use DTR and DSR as well as RTS and CTS

Thanks

Ralph

I have not seen your ref to pin * Ralph, but on the
three or four HT's and D700's I have connected so far,
you are correct in using 2, 3 and five.. If your unit
still does not receive data, then maybe reverse 2 and
3.. If you are using the cable from Kenwood to either
the D7 or D700, the red wire to pin two, white wire to
pin 3, and the shield goes to pin 5.. Should work but
give the GPS time to sync up.. You flavor may vary in
amount of time for the gps to sync up on the
satellites!!

73! and good luck

Robbie

I guess I shoulda looked closer at your statement
before I responded Ralph. Are you talking about the
serial cable pins or the GPS on both D7 and D700?? I
am so use to running trackers and forgetting some use
them for base stations, sorry..

Robbie

That's OK Robbie.
All I meant was "electrically". what signals does the radio want to make
serial data flow?
2 3 and 5 are NOT enough.

I knew the cable was straight thru. But I was asking which pins at minimum.
Most of the time, u just need TX RX and gnd, as you said.
I only had 3 wires in the cable and it did not work, so I just jumpered RTS
to CTS and DTR to DSR on each plug.
That way I didn't have to wire up a new cable.

The radio will not output anything without the jumpers (or a 9 pin straight
thru cable)

I am thinking of making up a three wire for my D-700 to see if it will
work. Would simplify my truck intall.I am now using a null cable with a
null adaptor(all i have for now,all others are in use).

I was using a laplink null cable with a null adapter too.
So that's why I decided to make a real cable before heading to California
next week.

Save yourself the trouble I went through and put in the jumpers or make it
like the book says 2-8 straight through.
3 wire will not work.

50. [htaprs] sending Aprs messeages with HT

From: "Dr. Werner Furlan"<furlan@gmx.net>
Date: Sun, 10 Sep 2000 21:43:00 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-108559-2000.09.10-14.53.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

hello,

is it possible to send / receive Aprs messages with a simple
terminal program connected to the THD7 / TM700 ?
(my wish would be to connect my HP200 palmtop to the HT and
communicate with this.)
I know that the Aprs Dos software would run on the palmtop, but
it is said to be pretty slow on this small PC and uses the full
memory.

I bought something this weekend at a ham fest and now I need to figure out what it does.

It's a "Magnavox MX4818 Differential GPS Reference Station".   p/n 707384-801 s/n 815

It's a big blue box with an N type ANTENNA connector, 2 External Freq Std BNC connectors, 5 and 10 MHz, a connector for "CDU" and another for Data I/O. Both of these are connected to a Siamese cable marked "RS422 CONV".   Inside it has cards interconnected on the front with coax. One care has what looks like a crystal oven, another with e-proms, and then 6 cards that look the same.   Then 3 empty slots. The case is in mint condition.

Now... what does this thing do? I'm going to guess it connects to a GPS and an DGPS antenna and comes up with a perfect 10 and 5 MHz signal.   But since it does say 'Station" could it actually generate a DGPS signal for transmission?

Has anyone seen one of these? Or know what it's for?

SUre, just type in the message like this:

   :TOCALL   :here is a message }1

ANd the message goes out.
Watch for the ACK comming back.

Of course if the channel i s busy, you will need a filter to keep
everything else off your screen. DO that by setting the BUDLIST in your
TNC to only the station you are QSOing with...

then any dumb terminal program will work...

just one thing to keep in mind..... the *second* colon...always falls in
space number 11
i had a time getting this to work every time untill i figured this out...
copy the sample message below... and paste it into *notepad*... (so you have
the fixed width
font and every thing lines up properly...)   then print it out and

tape it somewhere on your laptop for future reference....

:TOCALL   :here is a message }1

I have probably forgotten the format, but aprs messages can be sent
and acked from a terminal program. Its something like

go into connected mode with something like RELAY,WIDE
in UNproto

Then type

callsign::message{0

to send a message to CALLSIGN

when callsign sends you one back, send callsign::{n where n is
the digit at the end of the message to stop him sending it again

Did this with a tnc and a psion for a while. The THD7 is easier.

:)
Carl

Thats right, but recently
they have also made a new mole for the new ones. (emap, etrax)

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL September 22-24, 2000

** Update 9/11/2000 **

A little more that one week away, the 19th Annual ARRL/TAPR Digital
Communications Conference is about to begin. For detailed information about
the conference, please visit the official DCC web page at
http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday
registration is for an entire afternoon APRS activities, demonstrations, and
presentations. Saturday registration includes conference proceedings,
lunch, and a full day of presentations. Saturday night includes Banquet,
dinner speaker, and prize drawing. Sunday registration is for the PICmicro
Design seminar.

Banquet Prize Drawings:
Grand Prize Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize Palm VII Personal Digital Assistant
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy Systems, LLC)

Map and coordinates:
A map of the conference hotel and coordinates are available at ftp://ftp.tapr.org/dcc/dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. Preliminary schedule is available from ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

APRS Seminar - Friday September 22, 2000

John Ackerman, N9UR	APRS WG
Steve Bible, N7HPR	T-238 Weather Station
John Blowsky, KB2SCS	APRS LOOKUP
Steve Bragg, KA9MVA	HamHud
Bob Bruninga, WB4APR	APRSdos, satellite, etc.
Steve Dimse, K4HG	Internet APRS
Walter Dunckel, KD6VYV	Serial Control of D7/D700
John Hansen, W2FS	KISS TNC, D700 Keyboard
Dale Huguley, KG5QD	Weather Server
Larry Gahagan, AB0JM	Wildfire Support
Byon Garranrant, N6BG	TinyTrack
Mike Musick, N0QBF	PalmAPRS/Tracker construction
Robert Osband, N4SCY	Public Service with APRS
Tom Schaefer, NY4I	APRS Email Gateway
Darryl Smith, VK2TDS	APRS in the 2000 Olympics
The Sprouls, WU2Z/KB2ICI	Mac/Win/XAPRS
Rob Wittner, KZ5RW	APRS-CE

Main Session, Paper Presentation - Saturday 23, 2000

Rendered body type: text/plain

now i remember.....(thanks to carl littlejohns last post...)

probably best to start with a reset on the tnc... (restore d) for
kantronics...
then int terminal... as the kantronics default to 'newuser' mode...

then:

1. change the unproto to relay.wide
2. put the tnc into converse mode

follow the instructions below:

> just one thing to keep in mind..... the *second* colon...always falls in
> space number 11
> i had a time getting this to work every time untill i figured this out...
> copy the sample message below... and paste it into *notepad*... (so you
have
> the fixed width font and every thing lines up properly...)   then print it
out and
> tape it somewhere on your laptop for future reference....

64. [htaprs] Bad audio

From: Garren Davis <garren.davis@qlogic.com>
Date: Tue, 12 Sep 2000 13:12:33 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-108973-2000.09.12-15.25.54--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I just had my THD7 upgraded to a G version. Now when I
transmit voice, the person receiving my transmission says
my audio is very bad. He says it sounds like I am off
frequency by a few kilohertz. I have changed the frequency
up and down a few kilohertz but that was not the problem.
Has anyone else had this problem? Is it just a wrong setting
or do I have to send it in again?

Thanks

Garren

I tried what you and others from the list told me but all I can get
out of my TM700 is a questionmark after pressing enter.
hmmm...
I must be doing something wrong.

I have another problem with my TM700, which is quite annoying:
My Aprs Data Band is A and I have the rig set up as a digipeater.
When I have a QSO on Band B, it happens that there is a Packet
received that the TM700 would digipeat.
Then the TM700 takes away the transmitter from me and
digipeats the packet, but then I do not get the transmitter back to
the microphone, so it happens that I press the PTT, and talk, but
nothing is sent out, and also the receiver is locked.
Do you know, how I can overcome this behaviour?

6 programmable status messages? Are you thinking of the CUSTOM 0 - CUSTOM 6
Mic-encoder style comments? Those aren't "programmable" in the sense you can
program text into them.. The only programmable status text is in Menu 2-9,
and there are three slots...

To All Kenwood TH-D7AG owners:

Kenwood is pleased to announce the availability of the latest version of
the TH-D7AG Memory Control Program (MCP) software. You can download this
Free of charge from our FTP site. This is not a beta version, but a final
release version 1.00.

Note: This version only works with the TH-D7A(G) or (G) upgraded version
radios. Kenwood reserves the right to make this software available in the
future for retail purchase. Please report any software bugs to Kenwood
Amateur Customer Service.

To download the software for the TH-D7AG go to Kenwood's FTP site:
ftp://ftp.kenwood.net/SOFTWARE/ If you have trouble with this URL go to:
www.kenwood.net and click on the download section.

Setup.exe? Why do they have to screw around with this windows installer BS?

Just give me the dang .EXE and be done with it.

Until then, i'll keep using Beta 0.1.....

Sounds like the TNC is still in command mode. Put it in converse mode with
the "CONV" or simply "K" command. Then, anything typed followed by a <CR>
will be transmitted as an "INFO" packet by the TNC with the appropriate from
CALL and PATH based on what you have set MYCALL and UNPROTO to.

It appears Kenwood has pulled the software from their FTP site. Hopefully
it is to resolve a minor glitch and we will see it again later today.

To those that don't like setup.exe: as a programmer that has written
commercially available Windows applications, setup.exe is a necessary evil.
 It handles making sure that DLLs are the proper version (everyone doesn't
upgrade their systems when new fixes come out), registering application
components, and providing an uninstall capability (required to use the
Windows logo). Bob B.'s program runs in DOS therefore not requiring system
setup (though he does include a program that creates a boot diskette so
aprsDos gets the most memory). WinAPRS is shareware which does not rely on
shared DLLs. APRS+SA has a short setup program to register components and
create directories.

The use of setup.exe does not indicate a contempt for the user's
capabilities, but rather a way to simplify installation by all users in
commercially available software.

  I guess that it's ok to post it... if not I'll pull it. You can grab it
by going to http://www.kd4moj.org
        Click on download files and then the THD7 link. Let me know if it works!

        My old site crashed so I just through this one up using frontpage. So it's
not exactly the best looking page! I'm workin' on it! [GRIN]

78. [htaprs] D700 in a 4Runner

From: "Chris Arndt" <carndt@slonet.org>
Date: Thu, 14 Sep 2000 22:44:04 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-109390-2000.09.15-00.51.56--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Tonight I completed the installation of a D700, and GPS in my wife's
4Runner. There are a few things about this install about which I thought
some of you might like to know.

The Runner has a covered storage space inside the back, on the right side.
In other markets it's intended for safety reflectors. In the US, it made a
perfect place for the D700 and GPS.

The antenna for the GPS is a Mobile Mark combination AMPS cellular/active
GPS. It's a white hockey puck style disk, about 4.25" diameter by 0.75"
thick. As the Runner is white, it matches the car. The cellular part is
unity gain, but performs better than a gain style glass mount. The antenna
mounts through a 5/8" hole, and requires access to the underside of the
roof to screw on the mounting nut. There are 2 coaxes, one for each
antenna, RG 58 for the cell, RG 172 for the GPS.

For a couple of months, I tried using a Garmin GPS II+ for the GPS. While
it worked OK most of the time, it locked up in the garage about once a week
if I left it on and had to be restarted, and AFAIK, can't be set to power
up off the power jack without being manually turned on with the power
button. That pretty much negates my stealthy installation...

After considering the hassle involved with reradiating the GPS satellite signal into the garage (we have aluminum shingles) I decided to abandon the II+ in favor of an Ashtech G8 Sensor Box. The Sensor Box has a G8 module in it, plus a DC regulator, SMA antenna connector, and the RS232 level converter and DB9F serial connector. It was easier for me to just buy the Sensor Box, rather than monkey around trying to do an enclosure and the interfacing myself. The GPS is mounted to the radio "top" (actually, "side" is more accurate, as the radio tranceiver is mounted vertically) with adhesive backed 3M hook-and-loop fastener. From powerup, with current data, it locks onto the satellites in about 45 seconds.

I ran power straight from the battery, through a Charge Guard controller. The Charge Guard monitors battery voltage and has a programmable timer in it. When the battery voltage rises after the engine starts, it powers up the radio, GPS, and cell phone. After the engine is shut off, it waits for the programmable time (I have it set to 15 minutes, I think it will go up to a couple of hours), and then shuts everything down. If the battery voltage drops too low, it will shut off early. There's also an override button on the side.

The control head is on the console in front of the shifter. It's not the most optimum viewing position for the driver, but Katie doesn't really look at it much anyway. I bought the overpriced Kenwood extension kit to connect the speaker, mic, and head to the radio.

The RF antenna is a black Larsen dual band cellular look-alike with an open coil in the center. It's mounted on a Hirschman 3/4" Motorola style mount. The Hirschmans are fully shielded, and use an FME connector to connect to the coax. That mount can be installed entirely from the top of the roof.

Probably the most amazing thing is that my wife let me cut the 2 antenna holes into her new 4Runner. The second is that I managed to cut the holes without screwing up paint or the sliding action of the moonroof. :-)

If anyone is interested in seeing pix of the installation, let me know. I can put some on a webpage this weekend.

73,

Chris KD6DSI

One more thing. I'm one of the many who received a bad 2.5mm stereo cord with their D700 for the GPS connection. At our local electronics store, I bought a Philmore No. 70-212 shielded jumper with that size connector on each end, and used one end to make the data. I'm keeping the other for a spare. The cable is heavier than the one supplied by Kenwood, and solderes easily. The retail cost was $5.12 for the jumper.

80. [htaprs] TH-D7 Voltmeter

From: Skip Allison <cfad07@email.mot.com>
Date: Fri, 15 Sep 2000 08:28:26 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-109428-2000.09.15-08.38.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone know how to get the voltmeter to work? The manual says the LCD is supposed to indocate battery voltage in transmit. When I transmit, the meter goes up all the way no matter what the condition of the battery. I thought the meter on transmit was power out. Now I don't know what is indicating. I wish there was a digital voltmeter

like my Icom W31 has. The only way I know the battery condition is - I
know it's low when the radio starts cycling on and off and you have to
take the battery off to shut off the radio!

>Original Message From: Peter Loveall <HamLists@ametx.com>

>To those that don't like setup.exe: as a programmer that has written
>commercially available Windows applications, setup.exe is a necessary evil.

>The use of setup.exe does not indicate a contempt for the user's
>capabilities, but rather a way to simplify installation by all users in
>commercially available software.

May I suggest Pete, that you have missed the point here.

This type of software is not used everyday on your PC at home. By not using
setup.exe, but having the program on a floppy, zip or CD; one can carry it
anywhere and run it on *any* PC anywhwere.

I have a number of similar programs that I use this way. Using setup.exe
that includes the most important uninstall part means that the host PC gets
it put into it's registry and any other place. Many uninstallers do not
delete everything that was installed and some even give the user the option
to delete or not, file names that the average user does not recognise.

Installing and then uninstalling is one of the weak points of windows that
hastens the need to re-install windows.

Alan, G4ENS

Rendered body type: text/plain

Original Message From: rwf <rwf@bsrg.org>
>Just found out the hard way that kenwood must want more than pins 2 3 and
5.
>The manual shows pins 2-8
>Anyone know EXACTLY which additional pins are needed for a minimal working
>cable?
>I'd be surprised if they actually use DTR and DSR as well as RTS and CTS

Well Ralph they do, if my cable for the TH-7E Mk II is the same on the D700,
or rather what ever you connect your Kenwood to, they cover themselves by
using both in their cable. The links are for use by this other equipment,
not the Kenwood.

I've just rung-out my PG-4W cable and although not at home, so I'am going
from memory, caution especially crossing over the Tx & Rx data lines 2 & 3.

D-9 Skt   2.5mm jack
1   DCD   NC

```
2    RXD    ---------------------------   TXD    Tip
3    TXD    ---------------------------    RXD    2nd
4    DTR    Skt Link to pin 6
5    GND    ---------------------------   GND    Body
6    DSR    Link from pin 4
7    RTS    Skt Link to pin 8
8    CTS    Link from pin 7
9               NC
```

So if making your own cable or juction box, you need only 3 wires in the cable and the two links to the computer / PDA at the end remote from the Kenwood rig.

The other problem reported has been with the GPS cable supplied by Kenwood. The wires inside the cable have a central support of a few strands of a plastic type of cord.

If this cord is twisted with the copper strands then it is difficult to solder. So cutout this cord before using the soldering iron.

Unlike the data cable, no ferite ring has been supplied, so you may need to supply your own. Garmin supplied me with one when they repaired my GPS-75 and I commented about interference on my 2m rig (before I got involved with APRS). The ferite ring on the GPS power/data cable was effective.

As a matter in interest, I use a junction box in my motor, so no null-modem cables or adaptors. Power and data cables for my GPS, Psion 5 and TH-7E all plug-in to this box.

83. [htaprs] APRSCE, TH-D7E & GPS

From: "Andy Davidson" <adavidson@xtra.co.nz>
Date: Fri, 15 Sep 2000 17:26:37
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-109538-2000.09.15-17.34.11--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I can get my TH-D7E to work fine with APRSCE on my Jornada 545, And I can also get my TH-D7e to work fine with my GPS (Lowrance Global Nav 212), however..... is it possible to get them all working simultaneosly, so the GPS updates the position beacon automatically???

The problem as I see it is the TH-D7 is in APRS mode when connected to the GPS, and in packet mode when connected to APRSCE. What it needs is some way to take the co-ordinates from the GPS when it is in packet mode, and feed it back to APRSCE?

Or does it do this somehow, and I've just missed something??

Cheers.
Andy

Kenwood has reposted the software at ftp://ftp.kenwood.net/software/thd7ag. Looks good. Lot's easier than keying everything in via the front panel.

Subject: [htaprs] New! TH-D7AG MCP Software Available Now! ver. 1.00

To All Kenwood TH-D7AG owners:

Kenwood is pleased to announce the availability of the latest version of
the TH-D7AG Memory Control Program (MCP) software. You can download this
Free of charge from our FTP site. This is not a beta version, but a final
release version 1.00.

Note: This version only works with the TH-D7A(G) or (G) upgraded version
radios. Kenwood reserves the right to make this software available in the
future for retail purchase. Please report any software bugs to Kenwood
Amateur Customer Service.

To download the software for the TH-D7AG go to Kenwood's FTP site:
ftp://ftp.kenwood.net/SOFTWARE/ If you have trouble with this URL go to:
www.kenwood.net and click on the download section.

73 Kenwood

Rendered body type: text/plain

There was a lot of interest in the ChargeGuard I used in my wife's 4Runner.
The ChargeGuard web page is:

http://www.chargeguard.com/what_is_charge.html

It appears that the manufacturer will sell them from the site for full
retail, about $75.

(BTW, the website is not very intuitive, but the info _is_ there...)

I can get them at a discount. I just don't know if there is enough interest
to make a group purchase worth while.

Radioshack.com (note the web site, not stores) currently has a 'special
clearance' on the Vector VE3 Battery Guard - a cigarette lighter plug to
socket, 10' lead, for up to 10amp draw, which switches of when the battery
voltage drops to 11.2V. Cat # 98-696, Price $4.99 - seems to work fine!

The commands
        GBAUD 4800
        GPSTEXT $GPRMC
will cause the indicated NMEA sentences to traverse the GPS->Radio->Serial out
path of the THD-7A. The software then needs to be able to recognize these
NMEA sentences in the TNC stream and to delineate them from normal APRS
packets.

I have implemented this in my APRS software ventures and it works fine... I
do not know if the existing APRS software packages such as APRSCE have logic
to handle this kind of data interleaving...

Rendered body type: text/plain

To turn on the processing of GPS sentences, go to Setup -> Communications
and click/tap on the GPS tab. Make sure the "GPS Enabled" checkbox is
checked.

If the TNC will be interleaving the GPS sentences with the other TNC data,
select:
"Get GPS Data from TNC (Automatic)".

If the TNC requires a Ctrl-E ($05) to coerce it into sending the most recent
GPS sentence, select:
"Get GPS Data from TNC using CTRL-E".

If the GPS is on a separate serial port, select:
"Get GPS Data from this Serial Port:",
and fill in the appropriate parameters for the serial port.

Hope this helps...

Subject: Final Update - DCC Orlando, FL Sep 22-24, 2000

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL - September 22-24, 2000

** Final Update 9/18/2000 **

Counting down the final days until the 19th Annual ARRL/TAPR Digital

Communications Conference this weekend in Orlando, Florida. For detailed information about the conference, please visit the official DCC web page at http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday registration is for an entire afternoon APRS activities, demonstrations, and

presentations. Saturday registration includes conference proceedings, lunch, and a full day of presentations. Saturday night includes Banquet, dinner speaker, and prize drawing. Sunday registration is for the PICmicro Design seminar.

DCC Social:
Please join us Friday evening at 7:00 PM for a social get together time. The social is generously hosted by the Packet Radio Users Group of Japan (PRUG).

PRUG Presentation:
Friday night the Packet Radio Users Group of Japan will present talks on their progress on high-speed digital networks in Japan.

Saturday Night Banquet Speaker:
Mr. Doug Campbell, of Triton Network Systems (http://www.triton-network.com)

will be our DCC Banquet Speaker. Triton Network Systems is located in Orlando, Florida.

Vice President Product Management, Marketing, & International Business as Vice President of International Sales, Marketing and Product Management, Mr.

Campbell leads the assessment of global community needs and spearheads the development of Triton Network Systems' product and marketing strategies.

Mr. Campbell cultivated his management skills in sales, marketing and product development working 17 years for Nortel Networks. While based in Singapore, he built a multifunctional pan-Asian team, which successfully captured a 100% market share with MCI-WorldCom Asia, successfully introducing a number of new products. Prior to this, Mr. Campbell was instrumental in the establishment of an SDH broadband equipment joint venture in China and served as a member of the company's Board of Directors.

Mr. Campbell received a Bachelor of Engineering Physics degree from the Royal Military College of Canada in Kingston, Canada, and a Master of Business Administration from IMD (University of Lausanne) in Switzerland.

Banquet Prize Drawings:
Grand Prize - Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize - Palm VII Personal Digital Assistant (donated by TAPR)
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy Systems, LLC)
Microchip PICSTART-PLUS PICmicro Programmer (donated by Microchip)

PIC Seminar Prize Drawing
Microchip MPLAB-ICD (donated by Microchip)

Project and Demonstration Room:
The DCC is a place where people can talk about their projects and gain ideas

for new ones. The Project and Demonstration Room has become a recent DCC tradition where people can bring and display their projects. The room will be located next to the registration room and across the hall from the main presentation room. The Project and Demonstration Room will open at registration time and be closed (locked) 11:00 PM Friday and Saturday night.

Map and coordinates:
A map of the conference hotel and coordinates are available at ftp://ftp.tapr.org/dcc/2000.dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. PDF version available from ftp://ftp.tapr.org/dcc/2000.dcc.speakers.pdf

Speaking schedule (subject to change) is available from ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

APRS Seminar - Friday September 22, 2000

John Ackerman, N9UR   APRS WG

I have purchased a Maha PB39 NiMh battery and C777 charger for my Kenwood
D7A. Both seem to work fine but now I am wondering about a few things.

1. Can I charge the NiMh battery with the Kenwood BC-17 charger?

2. Is there risk of overcharging either my Kenwood NiCd battery or the Maha
NiMh battery when I use the Kenwood 12V adapter during mobil use?

93. [htaprs] RE: D7A Battery charging?

From: AE5PL <HamLists@ametx.com>
Date: Wed, 20 Sep 2000 05:46:50 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-110284-2000.09.20-05.54.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

1.) You should be able to charge the battery with the BC-17. Beware that
this is a reallll slowwwww trickle charge.

2.) The battery is NOT charged when the radio is turned on!! (Yea, this was
a surprise to me, too). So, mobile operation off of the car battery does
not charge the radio battery thereby negating the concern about
overcharging. When the radio is turned off, it will trickle charge just
like with the BC-17. The charge rate is low enough that it shouldn't
adversely affect the NiMh battery as long as you don't leave the radio off
and the battery charger on for days.

Remember that NiMh batteries don't have memory effect, but they do have a
rather high static discharge rate. I would recharge the battery with the
speed charger every night if you use your handheld every day.

Hope this helps.

Pete Loveall AE5PL

Isn't the BC-17 a fast charger *only* (no trickle charge setting)? If so,
using it to charge a NiMH battery might not be the best thing to try!

> Remember that NiMh batteries don't have memory effect, but they do have a

That's what I do. I have three MaHa NiMH batteries which I use in (almost)
strict rotation on my D7A(G). One gets used everyday, all day for
monitoring our local repeater. When I go to work the next day, the old
battery is put in the MaHa charger, and a freshly charged battery as put
on the D7A(G). Each battery gets an equal work out and I'm guaranteed that
I have two fresh batteries... plus whatever's left in the battery still
attached to the radio... at all times.

Julian

I believe the BC-_19_ is the rapid charger.

If the NiMH packs are constructed correctly, they should charge on the BC-19
just fine. There's a contact labeled "T" on the battery - this is connected
to a thermistor inside the battery that the BC-19 uses to monitor internal
temperature. When the temperature starts to rise, the battery is considered
charged, and the rapid charging is switched to trickle.

There are two other _possible_ contacts for the positive end of the battery,
depending on the number of cells in the pack. The high-voltage pack I
bought from Dr. NiCad (Mr. NiCad?) at Dayton refused to rapid charge,
because the manufacturer used the same case tooling for the high- and
low-voltage packs. The same positive contact was used for both, but the
rapid charger couldn't deal with having the higher-voltage pack on the
lower-voltage charging contact - so after about a minute on the charger it
would stop charging and blink a red indicator light. The folks at Dr. NiCad
were very nice and swapped it out for the lower voltage pack. Everything
now works great as far as rapid charging goes. Caveat emptor.

I also have two "slim" low-voltage NiMH packs from W&W (?) and they charge
correctly.

YMMV.

i have had the maha pb39 nickle metal for about two months.   i use the
wall wart to charge it, the one that came with the thd-7   and when i put
it in the bc 19   the red lamp starts to flash after about five
minutes.....i am never sure if the flashing means it is still getting a
charge.

has anyone:

1. put the nickle metal in the bc 19 and had the green light come on
meaning its charged?

2. left the battery in the bc 19 with the red light flashing and then found
out that even if the light flashes its still getting a charge?

73
find me on a map! go to http://map.findu.com/kd8s-7 works only
if i am sending my position out and in satellite range

At 08:41 PM 09/19/2000 EDT, RASNM@aol.com wrote:
>I have purchased a Maha PB39 NiMh battery and C777 charger for my Kenwood
>D7A. Both seem to work fine but now I am wondering about a few things.

  At the Melbourne, FL hamfest several weeks ago, I did my annual HT battery shopping (actually will probably buy more in Orlando 2001) and Mr Nicad (http://www.batteriesamerica.com) was there with the usual THRONG of folks trying to buy batteries. Since I just got my D7a, of course I needed additional batteries. I bought the last PB-38 (1800mAh) and a PB-39. I needed a fast rate charger so they recommended the UDQ-9000 Universal charger.

  I'm use to a wall-wart and a drop in charger (for my commercial HT's as well as my amateur rigs). As advertised, this contraption will work out of the car (supplied with a cigarette AND a molex type plug for 12v) and the house.

  Now since this sucker will work with ANY battery (HT-Camcorder-etc), you have to adjust two things. The actual charging pins are on a "slider" that moves back and forth so you can match it up to the two contacts on your battery that mates with the back of your HT. The second adjustment is for depth... so if your contacts are halfway up your battery case or down near the bottom, you can adjust for anything. The battery is held in place by a magnet so if you are crusing down the highway and sling a 180, that sucker will NOT move! There is also a temp sensor that will slow down the charging process as your battery nears finish. There are also 3 LED indicators to let you know the progress of the charge

  The charger really works as advertised. I've put all my PB batteries on it from a partial charge to an almost total discharge (I know i'm not supposed to let them get down that far!) and then RE-ADJUSTED it for my Yaesu FT-50 batteries. Works on all of 'em... rain or shine.

  Now what really bites.... is having to re-adjust for the different batteries. Takes me about 10 minutes to get it adjusted and tweaked to work with a different size battery.

  End result...it works like advertised... 12V or 120V. Hamfest SPECIAL $39.95! (normally $59.95).

  If anyone want's some pictures.. I'll post them on my site. Gotta dig that Apple Quicktake 100 out of the closet.

  Now a quick plus for the Mr. Nicad/Ed Yost & Company/Batteries America bunch. I've always bought my batteries (and two chargers) from them at shows and those batteries last. A good honest group to deal with. Only drawback is they are so popular @ shows... you have to elbow your way up to their booth to snag the batteries up before they are gone! (NOT AFFILATED WITH THEM JUST A SATISFIED CUSTOMER!)

99. [htaprs] Kenwood D700 and Emap GPS

From: "Maurice Cuellar" <taprham@calmed.com>
Date: Thu, 21 Sep 2000 17:56:48 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-110515-2000.09.21-19.31.58--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I own a Kenwood D700 and I am trying to setup a GPS
to work with it.

I got a Garmin EMap.
and the data cable to go with it.
I got the 4pin rectangular plug.
Black, White and Green wires
http://www.garmin.com/support/faqs/1.html

And the kenwood wire.
Shield, Red, White wires.
http://216.133.235.165/Amateur/Instruction%20Manuals/TMD700A_Specialized.PDF

So I connected black to shield, White to Red and
Green to White.

Im not having got luck making the GPS talk to the
radio.

I set the GPS to NMEA out. at 4800baud
and I set the radio for GPS at NMEA.

There were 3 wires and I am pretty sure I connected
them correctly. Ground, Data In, Data Out.

But its still not sending the Long/Lat/etc. to the radio.

Any suggestions?

Data in on the Kenwood has to be connected to data out on the emap and
vice versa. Thats the most common problem in this case.
Take a voltmeter and check the output of the two cables. The cable that
shows a voltage is the Data out pin.

I just wanted to let everyone that I found the problem
with the GPS not sending data to my Kenwood D700.

It was a bad GPS data cable that came with my radio, I just assumed that
since it came straight out of the box from the factory that it was fine,
but I was wrong.

Although Kenwood advised me initially to reset the radio, they also
said to post my question here and thats what saved all my memories,
so I guess they are not that bad after all.

Special Thanks to:
Byron Smith and Dr. Werner Furlan for their help in assisting me
diagnosis the problem.

FYI:
This project costed $199 for the Garmin Emap and $22
for the data cable. But I returned the Garmin Emap for a
cheaper version the Garmin Etrek and its working just
fine. That GPS only costed $119 plus $22 for the data cable.

Next project is to get the Etrek GPS to work on my Palm IIIc,
but I dont even know where to begin.... I'll start my browsing now.

You might try switching the green, red, and white wires (white - white,
green - red). My TH-D7A(g) is wired the way you have it to an eTrex (same
pin outs as the eMap). But Kenwood might do things differently, colorwise,

with the 700.

Pete AE5PL

(Black is ground, so that is ok).

Rendered body type: text/plain

Radio Shack has finally started stocking a 3/32" (2.5mm) stereo plug (90
degree angle) (P/N 274-298). I have used it with my TH-D7A(G) and Garmin
eTrex (using Garmin's data cable) and it works perfect. Garmin's data cable
is MUCH sturdier than Kenwood's and the Radio Shack connector was relatively
easy to wire.

I am not affiliated with Radio Shack, just glad to have a local source for
parts.

73,

Pete Loveall AE5PL

105. [htaprs] D7 Icons

From: Skip Allison <cfad07@email.mot.com>
Date: Mon, 25 Sep 2000 10:27:30 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-111048-2000.09.25-10.37.24--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anybody know why icons from D7s are not displaying in WINAPRS? I see icons from other stations, but D7 stations just show up as a dot. My D7 used to show up as a bike icon. I didn't change anything on the D7 (intentionally anyway - it sometimes changes things by itself). I'm using a different TNC at home. I was using a KAM before and am now using a KAM with earlier firmware, but the same setup file.

Also, has anyone else been having problems with the D7 changing parameters on its own? My repeater offsets keep changing. The VHF repeater offset keeps changing to 630 kHz and the UHF changes to $%.*#@ (don't remember exactly what UHF changes to, but it show as garbage and the radio won't transmit) The first time it happened, I did a complete reset. The second time, I was able to change the offsets with the programming software. The last couple times I was able to copy a memory to the VFO and that corrected the offset. The memory channels don't change - just the default repeater offsets. I wasn't able to fix the offset from the radio. If I tried to change it from the radio, it would change in 20 kHz steps 630, 610, 590 . . . but wouldn't let me go to 600. I didn't have anything in memory with 600 kHz offsets, but do now. So now I can just copy the memory to the VFO.

Are you sure you didn't upgrade WinAPRS about the same time? There
have been reports that WinAPRS 2.4.6 drops the 100's digit from the
longitude on MIC-E formatted packets, and that 2.4.7 fixes this
problem. If you're dropping one of the characters, it's possible
that it's interpreting the wrong character later as the symbol.

Try upgrading WinAPRS.

I had the same problem with my new THD7-A that I bought in May. I sent it
back to them and they looked at it on the test rig and decided it was just too
weird to try and fix so they replaced it and sent me a new one that has worked
so much better (Got the G firmware upgrade while it was in, had to pay for it,
sigh).

109. [htaprs] 246 problem

From: "Tom Clarke" <fclarke@erols.com>
Date: Mon, 25 Sep 2000 17:05:33 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-111092-2000.09.25-16.14.30--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am trying to get 246 to work and having a peculiar problem. I seem to be
talking to the KAM+ ok and it is displaying packets at the bottom of the
screen, but nothing shows up on the map. The decoded packets in red at the
bottom do not show any call signs, just the data following the !

Any ideas? I have used my D7 and D700 as signal sources, as well as data
from the local network.

Hi guys!

Any police/fire/EMS folks out there had any problems
with the D7A being used on public safety frequencies?
Maybe the infamous D301 letting go? I would
like to know before I try it.

Thanx

The only problem would be that the D7 is not type accepted for transmission
out of the Ham Bands. I know of several Gov't agencies that frown upon
their people using non type accepted equipment...

Folks, I don't need a lesson in type acceptance. The argument over modified
radios was old back in 1983 when it started.

This rig is not and shouldn't be used there. But as a police officer I have
on a few occasions due to dead batteries or
other malfunctions been without communications when I was knee deep in
alligators.

I have at this time reached in the glove box of the squad car and took out a
radio I wasn't afraid of blowing up like this Kenwood, and used it. For
those of you who will loose sleep over that I'm sorry. My wife and kids were
grateful to see me come home that day.

Sorry to have bothered.

I agree having a back up radio for communications has workeed for me I work
rescue here in tn
I was doing a public service event with the radio club when I got called out
for a call. I would have had to drive 15 miles out of the way to retieve
public service radio before getting to scene plus have stood side by side
with a public service radio and it would not talk back to repeater used mine
radio and made it to repeater

Flip,

I work in emergency management and have used my FT-50R as a backup to the
Bendix-King that I usually use. I have no qualms about using non
type-accepted radios in situations that warrant it. The FT-50R had a
"sister" commercial radio, released under the Vertex name, but with the
same case/display. I'm sure it probably had the same circuitry, except it
was tuned for a different range of frequencies.

Personally, I don't think I'll ever try modifying my D7 because I've got my
FT-50. Besides, I'm still amazed at what Kenwood fit in that little radio
<grin>. The D7 is the only radio that I haven't opened yet. :)

The radio is listed in different places for prices from $399 to $450. Finding
the $399 price at a reputable place would be the optimal choice...

121. [htaprs] TH-D7A(G) and GPS Problems?

From: "Julian M. Frost" <jfrost@odaiko.ss.uci.edu>
Date: Thu, 28 Sep 2000 09:50:25 -0700 (PDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-111680-2000.09.28-11.59.05--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Several people have mentioned a problem they have experienced with their
newly modified Kenwood TH-D7A(G) handhelds when used with their GPS
receivers. Some have mentioned that the D7(G) loses the position reports
from the incoming NMEA data stream after the radio has been on for a
while, or other similar complaints.

Those that are experiencing these, or similar problems related to using a
GPS receiver with the D7A(G), please contact me directly at
jfrost@odaiko.ss.uci.edu. I'm working with Kenwood to get this issue
resolved and would appreciate any input you can provide.

Thanks,

Julian

Rendered body type: text/plain

Hello everybody,

Just have my TmD-700E last week, and two things strike me !

1- Do some of you try the "ramtest" command in packet mode ? If so
what does it output ? This is what I get from my TX :
- reset ram
- error adress 000defOf ---> how strange, isn't it
- 128 kbytes OK

and then the TNC freezes. I must Off/On to use it again !

! PLEASE BE CAREFULL ! If you want to try it, you must know that all
the params of the packet mode will be erase !

2- In aprs mode, all my beacons are sent to "TXUPU3". I could not
find a way to send them to the general adress APRS. Do you notice that too ?
And does someone have an answer that I miss ?

Thank's very much for any answer.

That is your LATITUDE and comment bits. Since APRS packets are to
everyone, we designed the Mic-E format to use those 6 bytes for latitude.
TXUPU3 decodes to 4850.53 N

so lets have some ideas on how we can use the freqs. for ham radio

i was thinking about a fulltime full duplex handshake system for my ham
station on the mountain to full time send fsk up and down to my shack on
remote control.

i could then have full time alarm status on the building and faults in the
ham machines

not allowed to have continous carrier on the ham bands .

more ideas???

aprs would work good i think except for people trying to use it to talk on

73
find me on a map! go to http://map.findu.com/kd8s-7 works only
if i am sending my position out and in satellite range

Hi all,

     Has anyone successfully imported repeater lists from ARRL Travel
Plus CD to any of Kenwood's "MCP" programming software, particularly
MCP-D700 and MCP-D7a? It'd be one heckuvalot easier programming in some
200-odd memories if I could do so automagically! I suppose I could send
a sample of the format to anyone interested ...   73

Rendered body type: text/plain

I sure would be interested in that type of solution! I just cut & pasted
150 frequencies from Travel Plus into the Kenwood D700 software and then
entered names, offset and PLs. It would be great to be able to import
frequencies for my next trip. For-that-matter is there an alternative
software that will take information from Travel Plus and import it into the
memory of the D700?

Thanks es 73

Richard / N1VXW

4. [htaprs] ADMIN: Monthly Message

From: Stan Horzepa <stanzepa@mail2.nai.net>
Date: Sun, 01 Oct 2000 22:54:22 +0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-112304-2000.10.01-22.04.43--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

(This message is posted on the HTAPRS SIG on a monthly basis.)

PURPOSE

The purpose of the HTAPRS SIG is to provide a forum for folks interested in discussing the new, hot technologies related to APRS (for example, the APRS-ready radios from Kenwood.)

POSTING MESSAGES

To post messages to the HTAPRS SIG, send email to htaprs@tapr.org

HTAPRS SIG RULES

The HTAPRS SIG has a few simple rules:

. Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

. Stick to the subject, i.e., hot technologies related to APRS. Subjects that are only tangentially related to hot technologies related to APRS (like "what kind of car should I buy for my new Kenwood transceiver?") may be considered off-topic. If you start a message with "this is off-topic□" then you are violating this rule.

. Be succinct when composing a message. (The HTAPRS SIG software has been optioned to limit the length of each message.)

. When quoting a previous message, only quote the parts of that message you are referencing. (The HTAPRS SIG software has been optioned to limit the length of a quote.)

. Do not send messages in HTML of Rich Text format.

. Do not send attachments.

. Cross-posting is not permitted. (The HTAPRS SIG software has been optioned to prevent cross-posting.)

. The HTAPRS SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the HTAPRS SIG, follow the directions you will find at the bottom of each message you receive from the HTAPRS SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the HTAPRS SIG, please email the HTAPRS SIG administrator at the address below.

Stan Horzepa, WA1LOU, wa1lou@tapr.org

Tony and all,

I'm looking forward to your new Link700, and the import feature would be a
great timesaver.

One thing I've found with Travel Plus is that when querying it you don't
always get all the repeaters which the ARRL repeater guide gives.

I queried the author, and he said his database was taken from the book.
Somewhere the ball got dropped. Try to find the three repeaters listed for
Marlboro MA in the repeater directory, when you use Travel Plus. Maybe it's
me?

Howard

I am a new owner of the Kenwood TH D7Ag, I have a 386(DOS) laptop and Psion 3a palmtop, in addition to a Pentium at home (win95). I looked at the software directory at TAPRS and don't know what to download! HELP (I'm assuming APRSDOS, but there are many selections including one that says lite...) Any help/suggestions would be greatly appreciated. (also, any suggestions for software to use the Kenwood for packet? Do I need a packet program or just a terminal emulator?)

Get ftp://tapr.org/aprssig/dosstuff/APRSdos/aprs848.zip

And then also get the maps for your area of the country which will be one
of these:

 Emapsxx
 Wmapsxx
 Smapsxx
 Cmapsxx
 Mmapsxx
 SEmapsxx
 NWmapsxx

Use PKUNZIP with the "-d" option to unzip them into your APRS directory.
Then run APRS848.EXE

Enjoy
Bob

George,

I'm subscribed in digest mode so I can't see if someone else has already
responded.

The DOS box will need the DOS program that Bob, WB4APR, referenced. The DOS program has some excellent help files that serve as a reference for all the other flavors of APRS, so be sure to get that file.

The Pentium box can run many things in addition to APRSdos. I use WinAPRS (http://aprs.rutgers.edu/) because I like the graphical interface and because it can run higher quality maps. There is also APRSplus which works in tandem with DeLorme's Street Atlas mapping program.

I don't know what will run on the Psion. If it's Palm-compatible, visit this site for more info: http://www.pocketaprs.com/index.html

For regular packet on a Windows machine, I prefer WinPack http://www.peaksys.fsbusiness.co.uk/ but you can just use the HyperTerminal program that comes with Windows.

For DOS, a lot of people prefer Paket 6.2 (ftp://ftp.tapr.org/software_lib/terminal/paKet62.zip . Maybe someone else can tell you about a good terminal program for the Psion -- or do a web search.

73,

Ralph, KC2RLM

10. [htaprs] SUNSAT in APRS mode NOW!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 6 Oct 2000 17:10:27 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-113404-2000.10.06-16.20.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Kenwood users, NOTE:

On Fri, 6 Oct 2000, [iso-8859-1] "Höller, Wolf-Dieter" OE7FTJ wrote:

> I have logged SUNSAT the last days with very strong signals, but there where
> no calls in APRS mode except SUNSAT-3 over Europe ..... Where are the
> EU-hams to experiment in APRS via satellites ?

APRS USERS NOTE: We now have a satellite Dedicated this week to APRS. SO far, only about 5 people have tried. If we dont use it, we may be sending a message to AMSAT that we are not interested. Anyone that can transmit FM on 436.290 +/- doppler can HIT it. Everyone with a D7(g) or D700 can hit *and* receive it. How many thousands of us are there? Only 5?

It comes over everywhere between about 5 to 9 PM evenings and 5 to 9 AM Daylight time in any time zone.... Exact times follow...

All you need is the STOCK RADIO and stock antenna. The signal is so strong that you can receive it easily on your D7(g) HT or your D700 MOBILE with any antenna. (9600 baud noise burst every 10 secs)

Although the downlink is only 9600 baud for right now, you can UPLINK either 1200 or 9600. If you get digipeated, you will hear the 9600 baud noise burst... So ANYONE that can transmit 1200 baud (or 9600)APRS on 436.290 will get in... (tune .280 at start of pass, end at .300 at end).

All you need to do is change your path to SUNSAT or APRSAT. THen transmit on 436.290 -/+ doppler and receive on 145.825. If you have a

D7(g) or D700 then also Set 9600 baud and APRS to A:RX B:TX and that is
it... Use it or lose it...

de WB4APR, Bob

For this 3 day weekend, here are the approximate pass times for the USA
evenings. Most of us will be asleep in the AM, so just set your radio to
145.825 before you go to bed, and see who you capture in the morning!

```
          PDT   CDT   EDT
          ----  ----  ----
Friday:   ....  ....  1706
          ....  1745  1845
          1725  1925  2025  Voice pass
          1902  2102
          2043

Saturday: 0433  0633  0733
          0612  0812  ....
          0804  ....  1803
          ....  1838  1938  Voice Pass
          1820  2020  2120
          2000  2200

Sunday:   0353  0553  0653
          0530  0730  0830
          0713  ....  1722
          ....  1802  1902
          1741  1941  2041  Voice Pass
          1920  2120

Monday:   ....  0512  0612
          0451  0651  0751
          0630  0830  ....
          0810  ....  1820
          ....  1902  2002  Voice Pass
          1840  2040
          2022  2222
```

Look closely at the pattern. It passes north to south in the evening and
south to north in the morning, every hour and a half, moving from the
east coast to the west coast. The middle evening pass is always VOICE
on 145.825 PAROT mode (this week)...

Went out just now and the satellite was wall to wall voice and I could hear
packet mixed in - seemed to be total chaos. All I could hear was a bunch
of people stepping on each other.

I was was told to make the PACKET PATH -- APRS VIA SUNSAT -- My TH-D7(G)
Doesn't accept that as a valid packet path. Are we confusing unprotocol
with packet path? What should packet path and unprotocol be?

I have packet path set to SUNSAT and Unprotocol set to APK002. Is this
correct?

Dazed and Confused,

Mark

Yes, UNPROTO referrs to AX.25 path of APRS VIA SUNSAT for any TNC. FOr
the D7, just enter SUNSAT. Never adjust the UNPROTOCOL in your D7 unless
you want to go to an ALTNET and no one else will be able to see your
messages unless they are on the same ALTNET...

OK so I think I got my APRS packet up to the satellite
tonight around 7:00PM.

Now how do I confirm it got there?
Yes, I got the POS beep on my Kenwood 700.

Is there a website to go to?

Thanks.

I was beaconing a few times last night on the 19:02 PST pass... Did
anyone catch me? I've only got a D7A (no [G]), so I couldn't recieve
at the same time.

> wont do it...

I'm still not convinced that it's a link budget issue. With around 8
watts into its monopole Sunsat telemetry is easily copied in Mode J.
Its UHF receivers are as sensitive as any you'll find, using the same
monopole in Mode B. With similar power, my guess is that you should
be able to get in with a whip.

As indicated in some messages to this group in June, the TH-D7A's 9k6
modem seems at fault (especially through the UHF transmitters). A
graphical summary (129 kB) of measurements done today is available as
<http://esl.ee.sun.ac.za/~lochner/aflaai/oogtoets.zip>.

On Sat, 7 Oct 2000, Johann Lochner wrote about experience with SUNSAT 9600
baud Mode B uplink:

> I'm still not convinced that it's a link budget issue. With around 8
> watts into its monopole, Sunsat telemetry is easily copied in Mode J.
> Its UHF receivers are as sensitive as any you'll find, using the same
> monopole in Mode B. With similar power, my guess is that you should
> be able to get in with a whip.

But that example takes an 8 dBi or so receive antenna on the ground in the
middle of the pass (6 dB closer). For horizon to horizon coverage, my
experience has been that I need about a 10 to 12 dB gain antenna for
reliable copy down to the horizon.

Thus, now in mode B with an HT with a whip on the uplink (no gain), that 8
to 12 dB is missing. SO I had to pick up the same link margin by going
to 1200 baud and picking up about 7 dB. Hummh... so these numbers appear
to me to be somewhat consistent...

OK so I am so happy I made it onto the satellite.
Thats so great!

So now that I made my first satellite contact.
Whats the next step?
I was able to beacon the satellite, but how do I send a message
to everyone? Or save a message onto the satellite.
How about crash the computer?...ok well I wont go that far.
Then the fun would be over for me and everyone. ;-)

I thought that the D700 announced new stations in APRS mode when the VS-3
was fitted. The main instruction book refers to p28 in the Specialised
Communications book - but p28 (nor any other that I can find) in that book
mentions the VS-3. Can anyone point me to a menu setting somewhere - or
correct my understanding of that the VS-3 does in APRS mode

Drew,
.
The note at the bottom right of page 28 instructs you to use Menu 1-2-4 when
using the VS-3 to select APRS only.

My D700 announces only origination call signs of messages addressed to me, and
text in the payload that begins with %

It would be nice to have it announce new stations but I haven't found a way to
do this.

Just like any APRS Message, Bulletin, Announcement, or Email.
Its only a digipeater in the sky. WIth it you can do anything you can do
on APRS but your range is over 1500 miles, not 20.

For satelite work it is best to set your MESSAGE GROUPS to "*" so that
your THD7(G) and D700 will capture all messages betwwen everyone so you
can read the mail...

Do NOT expect any ACKS. If you see your outgoing packet digipeated by the
satelite say twice, then you can assume the other person got it...

How do I setup my Kenwood 700 to digipeat
all the APRS traffic my radio can pickup from the Los
Angeles Area onto the Satellite?

And sorry for this question but I am a little new to this
APRS, but how do I send a Bulletin or Announcement,
and when is it proper to send either.

I know how to send an email and messages.

Seems like by trying to digi all that traffic through the Sat that it would
badly clog the uplink, denying other potential users (those TRYING to get
into Sunsat) the opportunity to digi their packets.

Just a thought..

Mike,

I appreciate your concern, I wouldnt want to clog the satellite either.
My goal is to experiment and I think that is the goal of the SUNSAT
even being in orbit. With only seeing a few call signs going up onto the
satellite I thought it would intresting see all those call signs show up.
I was only planning on trying it once, the next time the satellite.

Maurice
KF6USM

P.S. Comments welcome. Im very flexible and go with the flow.

See the topic in any manual, book. paper, or instructions about APRS.
THey all address the issue
>
> I know how to send an email and messages.

SImply send your message to BLN# for announcements or BLN@ for bulletins.
In this application, the differences are meaningless..

Interesting, as I am about to obtain one of these at
AES tomorrow. Does one need to leave the volume set up
to hear all the brapping to hear the VS-3. I would
think this would be a bad trade off.

Thanks

Rendered body type: text/plain

Hi Folks,

I finally was able to receive SO-35 early this morning while I was catching some Z's. I was pleased even shocked to find WB4ARR-7 in my THD7G's heard list. The status was "1200bd, stock whip!" but no position report. I also received WB4ARR-7's bulletin 3.

I had my machine on to receive the Oct. 10, 1122Z, 1300Z, and 1440Z passes. I presume it was the 1122Z pass; 7+ degrees above the horizon! Bob can you confirm that you were transmitting at that time??

I was using a K5OE 2M 3/8 wave vertical next to a east window on the second floor which helped.

Oh by the way I am in CM87SS, AKA, Baghdad-by-the-Bay.

Robert, KD6INI

Rendered body type: text/plain

Remember a month ago when OPAL offered to enable DIGIpeat for APRS, but
then only their own ground station was allowed because of the BUDLIST.
THey now say they have opened up the budlist so it is ready for another
test. Just digipeat VIA KF6RFX on 437.100 with DOppler BOTH UP AND DOWN!

```
Meaning  XMIT     RECEIVE
         437.090  437.110
         437.095  437.105
         437.100  437.100
         437.105  437.095
         437.110  437.090
```

OPAL is object number 26063 and these days comes over between 8 AM to 1 PM
and 10PM to 2 AM local sun time (daylight savings time).

Let us know if it works this time..

I am glad to hear that SO-35 SUNSAT can be heard. I have a d-700 and have
listened at what I thought were the correct times, (even the time published
for this last weekend) and I hear nothing. Not just can not connect, I her
nothing. Obviously I am doing something wrong. I routinely use the D-700
with aprs in the local area, so I have something right.

Any suggestions?

39. [htaprs] 9.6kb Audio from D7A

From: John Gorkos <jgorkos@san-carlos.rms.slb.com>
Date: Wed, 11 Oct 2000 10:53:46 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Rendered body type: text/plain

Does anyone know if the D7's earphone jack passes sufficient audio
bandwidth to support an external 9.6kbs modem? I have several hurdles
to clear to get a full-time Sat-Gate in operatiom:
1. get 9k6 soundcard modem working on Linux box. This means I need a
known good audio source for 9.6k packets, thus the need for the D7.
2. modify my FT-530 which is currently serving as the AB0OO-14 Igate
transciever to pass 9.6kbs audio, and feed it to the soundcard modem.
3. cobble up another version of aprsd to run coexist with the aprsd
that listens to the 1.2kbs terrestrial aprs network, and crossfeed the
satgate packets into the igate

  Has anyone ever worked 9k6 packet with a Yeasu FT-530? How about a
Icom W2AT? My choices of radio are pretty slim, obviously.

Awhile back someone noted that Radio Shack now has a nice 2.5 mm (3/32 inch)
90 degree stereo plug. PN 274-298. After looking in three different stores
and finding no peg hook between 274-292 and 300, someone finally asked me,
"Did you find everything?" My response was "No". A quick computer check
indicated available stock. Come to find out, the plugs are with those shiny
gold plated ones "designed to enhance the performance of your audio and
video components". Duh....I hope it does the same for my D7A.

Just thought I would pass this on to save some of you some shoe leather.

Hi John,

I'm confused as to why you need received audio from the TH-D7 - why not use
the internal TNC and feed the serial data to the computer? It's been a

while, but I think KISS receive may work, if that's the issue.

Also, from what I've heard of the audio quality from my TH-D7, and my
experience with 9k6 operation (about 7 years) the output from the handheld's
earphone jack won't cut it - that audio is already de-emphasized.

Also, if all you're looking for is receive, you'd probably be better off
with a scanner, modifying it to add a discriminator output port. More room
to work, too!

As for uplink issues, most of the FM-only radios with PLL frequency control
modulate that PLL to acheive deviation - and due to the nature of the PLL to
try to remove frequency errors so they stay locked, they tend to 'undo' the
low frequency components of 9k6 modulation, severely distorting the
transmited signal. The result is usually a very high bit error rate, to the
point that even across the bench, a good receiver has trouble copying a PLL
transmitter. Crystal-controlled transmitters, or radios that have a
seperate oscillator (from the PLL) that is FMed are the best commonly
available choices for 9k6 transmit.

Hope that helps!

73, Bob

As you can see below receiving SUNSAT isn't a problem but getting
signals thru it seems difficult at present.

Have tried APRSAT ,SUNSAT ,& SUNSAT-3 but no luck.
A local station was having lots of luck the other night using
SUNSAT.

Running the program in Mode B with full 50W into a triband colinear
giving 6.2db on 2m and around 8.4db on 70cm with no preamps

11/10/00 03:23:40 SO-35 436.28500 AZ 82 EL 4

A 20" whip would do 6 dB better. Your 8.4db colinear "gain" antenna,
is designed to put all that energy on the horizon where SUNSAT is at
least 6 to 10 dB further away.

But when SUNSAT is 6 to 10 dB closer, (say above 30 deg) the pattern on
your colinear is probably 6 to 10 dB down as well. So your colinear could
be the problem.

Use just a 3/4 wave whip (a 19.75" whip) to get plenty of high angle gain
(8dBi) when the satelite is 6 to 10 dB closer (above 30 deg) and you cant
get much better than that. Note that the 19.75 inch whip is also a
perfect satellite antenna on 2 meters also (1/4 wave).

That is the big problem I have had in getting people to try these
satellites, they all have "gain" mobile antennas, which are designed NOT
to have any gain UP.... THus, they dont see what I am seeing...

Now the difference is only a few dB, but with satellites and digital
thresholds, it does make a difference..

> plenty of high angle gain

How would the Radio Shack (ok - it's less then
optimum but I have one) discone work? It has a
"cap" that might restrict the higner angle radiation.
On the other hand, the lower elements slope up.

Bill

Bill, I have found that the RS discone works pretty well on passes close to
the horizon at least for receiving (up to about 45 degrees). I was
actually quite pleased that on a low 20 degree pass I was copying data
starting when the satellite hit about 6 degrees above the horizon. I have
been unsuccessful using a discone to TX thru the satellite though with my
TH-D7. But on low passes the satellite is pretty far away. Like 800-1000
nautical miles. It beats standing outside in 15 degree weather at 6:00 AM
with a whip antenna, which I did last Sunday.

In the future you might not want to mention that you got your antenna from
Radio Shack. There is a certain percentage of people on this SIG who think
that hams who buy premade stuff from Radio Shack are not worthy of the
hobby. Tell them you copied the Radio Shack discone design and made it
yourself out of welding rod and beer cans. In their eyes you will be so
much more of a ham then. You might not want to bother trying to use the
satellite at 6:00 AM either, as most other hams are still in bed (probably
from staying up late building vintage Heathkit TV's).

But hey, I'm just a lazy young punk who bought his way into this
hobby. (or so I'm told) :)

Message-ID: <LYR845-114613-2000.10.12-14.10.59--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Anyone know if the repeat of the GPS data to the RS232 continues when the mode is changed from Packet to APRS on the 700?

The user wants to use APRS mode in the radio for the APRS functions and to use Street Atlas in its native form for navigation. So he wants it to still echo the GPS data out the rs232 port all the time.

I checked the docs on the radio (at least in the specialized manual) and can't even see where that mode set is done. I remember setting it, though, when I set up the D7 to use with APRS+

I can't check my own setup right now because the different pieces are locked up in different places

It will be at least 3 to 6 dB worse and every dB helps.
The 19" whip is 3/4 with a gain of 8 dBi above 30 deg on 435 MHz

THe discone is jsut a broad band dipole and so its gain is betwen 2 to 3 dBi. Not the 8 dBi of the whip.

It takes about 10 minutes to make one. Just dril a hole in anything metalic that is a few feet across, stick a BNC connector in the hold and solder a 19.75 inch piece of copper wire in it. Done..

To make some noise, tonight I am going to set up a copy of APRSdr that

will maintain a DR track on all the GAS balloonos and uplink them once a
minute to SUNSAT. Leave your D700's and D7(g) on 145.825 APRS mode
9600 baud when you go to bed tonight and see if you see them in the
morning.

Bob,
  At present, only 2 trackers appear to be getting into APRServe. The other 7
have locations that are 2 + hours old. One of these was reported dead last
night. I suspect that another died in S. Wisconsin while I was copying it
direct this afternoon.

It will be interesting to analyze the tracks to see where the coverage holes
are. I noticed that the balloons and chase vehicles appear to be using
Wide5-5. The chase vehicles would certainly have benefited by also using
relay.

I dont think so, 30 degrees is WAY up there, and what comes off the
horizon of the 20" whip is probably down more than 10 dB, so it would be
useless on flat ground...

On the THD7-A the command is "GPSTEXT $GPRMC" to tell it to send GPS data
while in packet mode. This apparently does not work in kiss mode
though...sigh... Would have been nice to be able to get $GPRMC stuff and
still do digipeating while mobile... Some day, we'll loose all the digi's in
a big storm and be all the more wiser....

I followed Bob's advice, left the radio on overnight,
and found the following on the D700 screen this morning. At
1240Z, SUNSAT-3 appeared on my list and left the following
STATUS message (I have no idea what it all means - this is
new to me). The STATUS message field was the only one that
had any data in it. I am in Silicon Valley (San Jose), CA.

   OBC1v8: up=0/08:43:16, rst=p

>
> I'm not sure what it all means, but its interesting. I am in Grandview, Mo,
> near Kansas City.73   Don, WA7SFL

Here is the answer:
Here is how to interpret SUNSAT APRS Status and Telemetry packets:

>OBC1v8: up=20/01:49:17, rst=wdog, Tue Oct 10 11:18:06 UTC 2000

FIELD1: On Board Computer software version
FIELD2: Up time in Days, Hours, Minutes and Seconds
FIELD3: Reason for the last RESET (POWER-ON, TELECOMMAND, or WATCHDOG)
FIELD4: Onboard Clock Time

The SUNSAT APRS telemetry is sampled once every 4 minutes. Thus, in 24
samples, you get a full 98 minutes of data which constitues one orbit.
To give whole orbit data, the 24 sample telemetry buffer is transmitted
one packet every 9.6 seconds so that a complete set can be received in
just 4 minutes. THus the 000 packet is the current value and each
subsequent one is the previous 4 minute one:

SUNSAT-3>APRS:T#000,098,133,140,041,046,11100000
SUNSAT-3>APRS:T#001,099,138,110,041,038,11111111
SUNSAT-3>APRS:T#002,099,140,191,042,040,11111100... etc

Telemetry data is identified by a T# header , then a serial number, then
5 analog telemetry channels, and then 8 Binary Bits.

SERIAL#:   Whole Orbit buffer pointer (0 in the first example above),
CHANNEL1:   Battery state of charge percent (98 %)
CHANNEL2:   Battery voltage in 10ths of a volt (13.3 V)
CHANNEL3:   Battery charge current -128 in 10's of Milliamps
                (140 - 128)*10 = 120 ma
CHANNEL4:   Battery temperature in degrees C (41 øC),
CHANNEL5:   Top plate sun sensor reading (46, an uncalibrated value).
BINARY BITS: The last field indicates the state of the 8 solar panels
                (0: sourcing the power bus, 1: shunted, dumping energy).

The above telemetry was when SUNSAT was over Arkansas and it was just sunrise in
Maryland. Thus SUNSAT was in daylight even though Arkansas was in dark.

5 07 pm pacific time

    well i have been sitting here since 1pm reading the tmd-700 and trying things.

i can't seem to find a comand to make the tmd-700 only digi my own signal from the th-d7

it receives everyone else and relays .

still looking for the answer on how to make the tmd-700 receive then digi just my kewood th-d7.

any ideas please post

What about using CTCSS on the D7, and the D700?

to make the tmd-700 digi only my signal, i go in on a frequency different than 144.39, the d-700 sees
my signal then xmits on 144.39 relay mode.

operate it like a repeater split.

works good.

Just set the D700 to something other than relay

Use something like truck, car, and then in the D7 use the new alias of your
D700 in the digi path.

Dwight

66. [htaprs] Re: Small keyboard for Citadels

From: Arte Booten <n2zrc@webspan.net>
Date: Sun, 15 Oct 2000 11:40:53 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-115152-2000.10.15-10.52.21--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I wrote:

>I mentioned a small keyboard available from PFUCA, but didn't have the
>particulars on it as I do now.

to which Dave (K7IOU) replied:

>>I use a Dauphin keyboard with my citadel. Bought it new at Dayton for
>>$8.00.

so I asked him:

>Do you have a URL for them?

He didn't, but I found them in a Dutch Auction at E-bay for $11.45:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=463695405

DAUPHIN Mini PS/2 Keyboard

Tiny and very light keyboard for pda's, mobile application
or small spaces like kiosks. Tiltable with an 8 inch cable.
Connection: PS2. (Right angle plug)
Keys: 82, Soft touch
Dimensions: 9.37" x 5.48" x 0.84"
BRAND NEW in Bulk Packaging
90 DAYS CCC WARRANTY

The seller had some 600 reviews, a dozen neutral and a dozen negative. Out of 600, you're bound to get two dozen disgruntled souls, I suppose. I've placed my bid at $11.50 ... I also think that once this bid's over, the seller will bring them back again (it seems to be a business, but I couldn't get on their website [http://www.allelec.com] as it kept timing out). BTW, the item goes off bid tomorrow (Monday) at 2:37 PM PDT.

The APRS connection here is that this keyboard is handy to use with Citadel Touch-Screen APRS computers. It's a continuation of a previous thread. I also have no connection with either Ebay or Allelec (or whatever the company's real name is). 73

Rendered body type: text/plain

I just returned from my early elk hunt and ran into an interesting GPS navigation problem and figured I should share it with the group before some newbie gets in trouble.

During this last week I was in the Ryderwood Hunting area in SW Washington and noticed that I had lots of problems getting a proper fix on my GPS during most of the day. I was using a Garmin III+ and even convinced myself that the GPS had died on me, but that was not the case. When I did get a fix, it was continuously drifting over an area of over a half mile. The GPS did not even display the proper direction for North! Even when I set it to North as up, it still pointed in different directions as I would move (even with my truck). It caused lots of confusion to say the least especially when my second III+ acted the same way.

This weird problem was caused by poor (insufficient) satellite coverage. Looking at the satellite screen, there were times I only had 5 satellites on the screen with none inside the 45 degree circle and I was in steep mountainous terrain. This virtually made the GPS useless for most of the time I spend in the woods. Previously, using my III+ in the mountains gave me a proper fix 99% of the times. On this trip it was less than 25% of the times that my GPS was even usable for navigation. Fortunately there were 4 or 5 satellites in the center circle late in the day when it was most crucial to get a good fix since I was several miles in the woods with no access roads.

The bottom line is, GPS Navigation is great, however, make sure you do not rely on your GPS for your only means of navigation in the back country. You

must still know how to use and actually use your old fashion compass for most of your navigation, otherwise, you might spend some unexpected times in the woods. Since I am from the old school, I still use my compass for most of my navigation and only use the GPS to get periodic updates of my location and corrections for my compass directions. Even when I did not get a fix, I still used the GPS Topo map in the background for information, so, I also advise you to periodically get a fix on your GPS so that you will at least know where you were earlier in the day and have the background map display the area you are in.

Just a word to the wise. If you are new to the outdoors and use your high tech GPS toys, you still need to learn how to use a compass and be able to navigate with only a compass should problems arise with your GPS or GPS coverage. I know this sounds stupid to the old timers, but I would hate to see more SAR activities on trying to locate lost hikers.

Rendered body type: text/plain

got response to try a few settings to make my tmd700 digi ONLY my th-d7

tried this

put the tmd700 uidigi from relay to car repeated all traffic

put the tmd700 packet path from relay,wide to car repeated all traffic

changed unproto from apk101 to car repeated all traffic.

the only way for sure that it works to digi only me is to set up the base station and the handheld for reverse operation

any other ideas to try to make the tmd700 on 144.39 digi just my handheld (kd8s-9)

let me know.

my tmd700 is kd8s-7

Herb,

Good advice. Mariners are taught to never depend on only one means of
navigation. Several years ago, a boater on Long Island Sound broke this
rule, and the end result was about seven dead people, 4 of whom were his own
family.

Too many "newbies" to boating and other activities involving the need for
navigation are either unaware of, or are disregarding, this basic tenet.

NEVER depend on only one form of navigation.

Howard

Hi there,

When you put digipeat off .. does this include packet mode and aprs mode or
only aprs mode...

Try turning it off and put the 700 in aprs mode...

Maybe it digis in aprs when uidigi call is put in.. with an empty uidigi
call it is possible it is not be relaying anything..

just a thought.. didnt try it out...

Hi

I tried and it went OK..

Try following..

TMD 700 in APRS mode
uidigi car
digipeat on.
packet path   doesnmatter

THD7
aprs mode
packetpath car

When the thd7 transmit data only the tmd700 responds and digis the packet...

If you have your tmd700 in packet mode it digis everything.....

good luck

by the way my both models are E Types

Is it possible that both of Herb's III+ units could have had bad
ephemeris loads?

It seems to me that even with only 5 sats in view and fair geometry
that a good fix should have been possible.

The unproto path will not change anything. What you are looking for it the
equivalent of an ALIAS - I dont have a 700 so I dunno. Is UIdigi the same as
alias?

Carl

I use one on mine, but the keys stick after a week a Burning Man.
I blew the dust out . They stick on pushing down and return OK.
I think the heat shrunk the hole the keys fit in. Once you punch all the
keys a few times they work intillnext time.

Hi all,

     There's something bothering me about this thread.   One of the con-
cepts essential to the operation of a healthy APRS network is that each

and every fixed station serve as a RELAY for any mobile and portable ops
that might not otherwise be heard by the "real" WIDEs, thus getting them
into the local APRS network.

     While Steve may have some legitimate reason for getting his D-700
to relay his D-7a, it would be detrimental to most APRS networks to de-
feat this basic concept in APRS. I'm sure there are ways of making his
D-700 do what he wants without fiddling with its ability to act as RELAY
to any and all APRS'ers passing by that might be otherwise unable to get
into the local APRS network.   73

The answer is that he adds MYDIGI to his UIDIGI list. THen his HT uses
via MYDIGI... NOthing to it..

Well here it goes,

I ordered a D7A(G)!

I received a D7A! (ser. # 201XXXXXXX)

The friendly dealer has sent me a D7A(G)! (ser.# 204XXXXXXXX)

NOW, the "beacon" worked on the D7A, but does NOT work on the D7A(G)!!!!

I have followed the "enhanced features" instrutions on page 15 to the
letter with no joy.

Has someone else been frustrated in this same manner?????

Does someone have an answer??? Kenwood are you listening???

Despite the frustrations this little radio is certainly a major achievement
on Kenwood's part!

I bit the bullet and purchased a kenwood. My question is: when
setting status(?) the default of "off duty" is selected. There is a
selection of "custom "0-x" but no mention of how setup a custom
entry. Any ideas?
Thanks
Bruce

I bought one at Hamvention this year and have had no problems with it at
all. Good for mobile ops (had Citadel strapped to glove box, KB sat on
dash when my "Nav" wasn't using it). The only thing I recommend is to
buy a PS/2 Keyboard extension cable for it. The one on the KB is too
short to be really practical IMHO.

81. [htaprs] GPS / D7A(G) Serial Port

From: drober05@prodigy.net
Date: Mon, 16 Oct 2000 07:12:29 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-115280-2000.10.16-09.22.04--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

I have a Rand McNally StreetFinder GPS receiver that works fantastic
(especially considering the low price) for interfacing to my
laptop to provide real-time road map tracking. I would like
to use the same receiver to provide NMEA messages to my D7A(G)
while simultaneously sending them to the laptop. Is it possible
to split the serial signal to go to both places? Seems like
this might be possible since no messages are going back to the
GPS from the laptop or D7A.

Would this simply be a matter of making a serial cable with two
connectors, one for the D7A and one for the laptop? Or, do I
need some type of splitter box? I considered trying to run the
GPS messages into the laptop then from the laptop to the D7A.

However, my laptop has only a single serial port.

This is all part of a larger project to install a "van PC" into
my van for navigation, entertainment, Ham, etc. I posted a request
several months ago for suggestions on potential monitors. Since
then I have found sources of nice flip-down LCD screens for automotive
use. These would work great for my needs but are priced a little
high at over $500 for the screen alone. I anticipate this coming
down as the technology improves and competition heats up. For
now I am just using my laptop screen. It's rather awkward and
doesn't look as cool but it's functional.

Thanks for any assistance.

>NOW, the "beacon" worked on the D7A, but does NOT work on the D7A(G)!!!!

There are several things about the 'G' that you have to tend to. First,
if you change the radio from GPS->'Not Used' to GPS->'NMEA', you must either
power cycle the radio, or switch the TNC to packet->off->on again to get the
radio to recognize that the GPS port should now be active. Once you do this,
you should hear the 'bonk' of the 'no fix' condition in the audio until you
have a fix. The radio will beacon whatever 'bad data' the GPS is sending to
it until a 'fix' occurs.

Next, and I consider this a bug, when the radio is in GPS->'NMEA' mode, and a
GPS is not attached, you can not send text messages until you set it to GPS->
'NONE'! Keep this in mind when you jump out of the car after unplugging the
radio and are trying to send a message as you are running to help someone!

Rendered body type: text/plain

hi sig

       well just tried bob bruninga idea for setting my d700 and thd7 to
digi just me.

i walk an hour each day and can not hit the two Las Vegas digis due to
mountain shadowing.

I did have the d700 to relay all traffic but it caused a lot of collisions
on the freq.

all i really need it to do is digi just me when i run my thd7 while
walking a 5 mile route in the neighborhood.

got tons of suggestions on how to set my rigs, spent all weekend on it, but
the tiny tracks were being digipeated no matter what i did.

here is what i have now

tmd700   unidigi   set for   mydigi

digipeater	on
unprotocol	apk101
packet path	relay,wide
msg group	all,cq,qst,kwd
bln group	no settings at all
my callsign	kd8s-7

on my thd7

unprotocol	apk002
msg group	all,qst,cq,kwd
my callsign	kd8s-9
packet path	relay, wide, my digi

so far my tmd-700 is not rexmitting anyone but me, but there is little
traffic on 144.39 here in las vegas this morning

i will leave it on today and see what happens.

thanks for all the ideas

been monitoring the freq, and the others in the murs list.

i did read the restrictions on the murs .

i think the hams have plenty of frequencies to play with, but i happen to
have commercial radios near 151 mhz, that i can use in that band but its
not cost effective to move it to the ham bands. so i figure grab the
commercial freq. and use it just because, its there and spectrum space.

i would be glad to grab 151.880 here in las vegas for ham use

Hi there! New to *this* list (been on the regular APRS list for years)
since I just bought a nice new D-700A a couple of days ago I figure I ought
to sign up here as well!

I haven't paid all that much attention to the Kenwood radios when they were
mentioned on the regular SIG, so I'm sure there's a lot of stuff I don't
know. I've got my radio up and running in the car (N1JDU-9) with my
"ancient" Garmin 45. Everything seems to be working, but I have a few
questions...

Do the Kenwood radios transmit position information in MIC-E format?
Because, there is no menu choice to say which GPS data sentence to use, and
I've noticed that watching other Kenwood mobiles they do not activate the
GPS-Time-Sync feature of APRSDos. In other words, they do not transmit a
specific GPS string like a "normal" tracker. (I had a favorite string I
prefered to use in the past with my dumb tracker) This is ok, I just want
to be sure I understand it correctly.

There seems to be no way to scroll a received comment or status line to see
the whole thing, correct?

I'm sure I'll have more questions, but I know this should be *the* place
for answers! Looking forward to having fun with the radio.

And of course the easiest would have been to do nothing but use the path
of VIA KD8S-7,WIDE,WIDE from your THD7. THen you dont have to change
anything in the mobile.

But it appears that you have your calls backwards. Most people use the -7
for their D7 and -9 for their mobile.... In that case you would set your
D& to digi via KS8s-9,WIDE,WIDE

OK - new Ham here...We're using hand-held and mobile Kenwoods for a
balloon experiment (Yes, we intend to fly the TH-D7A(G)). Undergoing
environmental tests now.
My question is about call sign dash numbers. Have been using my call and
assigning a dash to each radio. Is there a prefered allotment?
I think APRS software, somewhere, assumes a balloon is dash eleven
(-11). Is that the case, and why?
The fabulous Bob Bruninga states -7 for the handheld and -9 for the
mobile. Is there a pattern here?
Thanks for any guidance!

Hi Robert,

Here in the Chicagoland area, it seems -11 = balloons, -7 =
Kenwood D7AG, and -1 was adopted for Kenwood D700A. There
also is a balloon Icon which is very well done..

Robbie, wa9inf

Rendered body type: text/plain

The 800Mhz is a sub-band on B side of the radio. If you have it in VFO mode
and are on the B side you can punch up the 800Mhz freqs.

OK, I'm in B VFO mode. I hit ENT then 8-6-0 then the display erases the

860 and replaces it with 479. It doesn't want me to enter anything
above 479. If I hit F-BAND it toggles between VHF and UHF. If I hit
F-BAND while in the A VFO it toggles between VHF and aircraft. I was
pretty sure it was receiving 800 at one time.

===> Well, Same for me, I apologize. I read the previous post too fast ! I don't think D7 covers 800Mhz,
 only 479,99 Mhz. If necessary, have a look at http://www.mods.dk/

Hi everybody,

I've got a TM-D700E, and 3 days ago I've crashed my TNC while it was in "aprs mode". The configuration
was : 144,800 tx side A (aprs in Europe) ; 439,975 rx side B (packet) ; 1200 bauds. Thought I was in
"aprs mode", I was trying to monitor packet on side B using [p.mon]. While I was receiving the first
frame on side B, the TNC frooze.

Now, even after many "full reset & hard reset", I can't perform any command in "packet mode". All I get
is sommething like "cmd : ?too long".

Has someone seen this before ? And, is there any way to perform a truly "full reset or hard reset" of
the TNC ?

Many thanks in advance for any help,

Regards,

Eric, F4COU

Hi all,

Ken C. wrote:

>Does the D700 [only decode data on the main band] when using dual band?

     It will decode data on the band designated as the data band via me-
nu item 1-6-1 (Radio-TNC-Data Band).

>When sending [one-liners] to a D700 the final line evoked the response
>rej13. Any ideas on what would cause this?

     I haven't seen this myself with the D700, but it sounds analagous
to what sometimes happens to someone sending messages to APRSDos users.
The arrays in APRSDos are a set size, including the page that displays
incoming and outgoing messages. When the messages page has filled up
and the operator hasn't made any additional space by either killing his
outgoing messages (ACKed or not) and/or deleting incoming messages, the
program will send a reject frame. It takes the form of rej##, where the
is the message number of the sender.

     Since both the D7 and D700 also have arrays of predetermined size,
and since they flag unread incoming messages, I suspect that the same,
or at least an analagous, situation is occurring here. Try pressing the
F key for a second, then the messages key and have the D700 list the in-
coming messages. Is there a "page" symbol to the left of any messages?
These are unread. Read 'em! This should free those message slots for
new incoming messages.

     BTW, there's an easier way to do this if you have quick fingers and
have the D700 set to beep on incoming messages. When you hear the dis-
tinctive "incoming messages beep", just press the OK key (the one on the
extreme right, next to the VFO-A Vol/Squelch dials). This tells the ra-
dio that you've read that message.   73

99. [htaprs] duplicate aprs packets

From: Scott Anderson <scott.anderson@stanford.edu>
Date: Sat, 21 Oct 2000 16:18:31 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-115971-2000.10.21-18.28.39--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,

I'm stumped. In trying to setup an aprsat downlink station, I've been
leaving my D7G on overnight and have been coming back lately to find all 40
positions filled with the same (exact) data. I've had it happen on two
different beacons, as well as the SUNSAT-3 beacon. I don't even think it
is possible that I could be getting 40 packets from the same source on the
same pass, as I just have been leaving my radio on -5kHz and no tuning
(436.245), and I am just using a big whip.

It used to just show a duplicate packet as such, and overwrite the old one,
as the manual says it should. Did I adjust a setting somewhere that made
it do this??

Scott

Please indulge me a little, I know this may or may not be the place to post
this question but here goes anyway.

I have been off the APRS air for about a year and now that I am trying to
get back on I can't make either of my three computers access the com ports
in the DOS mode. I am now running WIN98SE on Pentium Class machines, I did
not have problems when I was using WIN95 (when I last ran APRS). I have no
problem talking to the TNC with HyperTerm and other 32 bit applications but
none of my DOS based programs (including APRSdos ver. 846) will open either
com 1 or com 2. I know that it is time to upgrade to APRS+SA, but I kind of
like the DOS version. I have been to the MS Knowledge Base and have
disabled the ACPI support for the ports and have run MODE COM, but still no
luck. I have set the pif to ignore Windows and have even tried it in the
exclusive DOS mode without any luck. I wrote a little bat file to invoke
the switch suffix to load the config file and it works just fine, the
problem still exists. I am using several AEA PK12's and they have always
worked fine. If anyone is still running APRSdos and has made it work on
98SE please let me know what you have done. I don't have enough hair left
to pull anymore out!

Hi Loyd,
Many thanks for your answer ; removing the battery is good idea and I didn't think to that. But after some other tests, I found the reason of my problem : it was due to a short circuit in the wire between my computer and the tx... The simplest reason is always the better one...!!

And sorry for the spend of time and bandwith.

I have an Earthmate GPS Receiver by DeLorme which works great to my laptop with the DeLorme Street Atlas Version 6.0 .   I am unable to get the Earthmate to work with my Kenwood TH-D7A.   I believe my wiring is correct because the Earthmate seems to be transmitting (?), and I have set my "My Call" and "NMEA" in the menu of the TH-D7A. Being in a good receive location, I am never able to any information for "My position" on the TH-D7A display. Any help or suggestions would be welcomed. TU,
Mel AB6QM

Hi Mel, and all,

Unfortunatly the Earthmate doesn't produce NMEA compatible data strings. I went round and round with Delorme about this, and it seems I finally convinced them that the Earthmate isn't NMEA compatible, because the data that it puts out is not in any of the recognized NMEA formats. They recognized that the output is proprietary, but on the basis of the electrical characteristics (voltage swings, baud rate) of the output, they wanted to claim it to be NMEA compatible. Since I can't find any reference to NMEA and the Earthmate on their site, it appears they've stuck to their word. So I'm afraid that unless someone creates a translater board (another PIC product?) to translate the Earthmate data stream into an NMEA stream, your GPS isn't going to help you with APRS.

If you just recently purchased this combo from Delorme, you could try to see if they'll swap an Earthmate for a Tripmate, however it requires some clever wiring on the DB-9 connector to get it to start presenting NMEA data on the output, so it's not quite plug-n-play either.

73, Bob, KD7NM

At 12:53 PM 10/23/00, Mel F Nunes wrote:

>...I am unable to get
>the Earthmate to work with my Kenwood TH-D7A...

This is because the Earthmate doesn't output a standard NMEA sentence, which is required for just about any piece of APRS or GPS capable packet hardware. The Earthmate only sends out data in a proprietarty (Rockwell Binary) format. There are some hardware workarounds for this. One is the GST-1 Rockwell Binary to NMEA converter. http://www.byonics.com

The are a few drawbacks to the GST-1. First is cost. Currently it's $45 plus shipping which puts it within $25 of purchasing a Rand McNally GPS engine (mine was $73 with tax and shipping purchased directly from RM).

Second, the GST-1 derives it's power from the computer or TNC's serial connection. Not all computers are made equally, so it may not work with your computer. If it doesn't work you will have to wire up an external power source. Running the GST-1 connected to the Earthmate in a stand-alone mode with your HT will REQUIRE that you wire up this external power source.

My advice would be to purchase a different GPS engine or handheld GPS for use with the TH-D7. Something very small like the Garmin eTrex might suit your needs, and it will also give you a display or your Lat/Lon etc. If you have a little more money to spend, I would recommend the Garmin eMap. The eMap allows 2-way NMEA data exchange and is a mapping GPS. This allows you to use the GPS as an APRS display and any received stations will show up on the eMap's screen as waypoints. Very cool. For a standalone GPS engine, the Rand McNally unit is the current price leader costing $70 - $100 depending on where you purchase it.

No matter what you do, it's going to involve spending more money. Sorry.

73,

Mark

The GST-1 was specifically designed to convert Earthmate (or other Rockwell
binary format GPS) data output to NEMA.

I would not buy a new Earthmate for APRS knowing I'd have to spend another
$45+shipping to get the GST-1 to make it work with APRS or a tracker but
someone who either just happens to have an Earthmate (whether they bought it
before they did APRS or it was a gift etc) its a perfect solution.

Another one of Byon's (N6BG) cool devices using a Microcontroller!!

You can use B to talk on another VHF Frequency just program it and off you
go. The only thing I am not sure is if like on D-700 you set your A on APRS
and select B as the PTT channel APRS will still send position at the
predetermined interval.

Hi Scott.. It is in the manual.. After having A channel
tuned into aprs channel as usual, hit A/B button to make B
channel active, then hit F (function), and then A/B This
then makes both sides of the radio VHF... You're Welcome...
:-)

Not only does it work, but it works really well. If you have selected the
voice repeater on B band and it is time to send your position on APRS, the
radio will automatically switch to A Band, send your position and then
return to B Band. The only problem is, it will interrupt the voice channel
whether you like it or not during that time.

Rendered body type: text/plain

LEONIDS METEOR SHOWER REGISTRATION --

Web Page registration is now available for those who will be participating
in the upcoming November Leonids Meteor Shower event. The purpose of
registering is to provide a real-time list of participants. This should
expedite communication and increase the chances of success. There are 8
questions, it should take about 1 minute to complete. Click on the URL
below and then click on REGISTER.

http://w9if.net/cgi-bin/beaconet/main.pl

I got interested in this facet of amateur radio after reading the article
by W2EV in the Nov 99 issue of QST. I quickly realized that my chances of
success could be increased if I knew who was participating so I knew where
to point the beam. It was out of this need that I developed this
registration page. I hope that you find it useful.

For those interested in more information, the Nov 1999 QST article by W2EV
and the Nov 2000 issue of QST (page 28 and 83) may be useful.

To prevent this, set the DCD sense in the TNC section of menu 1 to "Both

Bands." This will keep the TNC from transmitting while either channel
is
busy, or when you are transmitting on the voice side.

Use it with care, though. If your voice channel is busy all of the
time,
like for a special event, you will never transmit a posit. In that
case,
it is better to go back to DCD sense on D-band only.

Rendered body type: text/plain

Hi all

Sorry that this is a little off the subject but I need some help with a
small problem I have.

I have a GPS companion. This is a GPS engine that clips onto a Palm Vx unit.
I know I can not use it for APRS but what I do want to know is does any one
know if you can convert the map files (*.pdb)(Magellan call them shape
files) into a usable TIF/BMP/GIF/JPG type of file. One would presume if you
can convert from the *.pdb to a *.jpg or what ever you can also convert from
a *.jpg to a *.pdb etc.

I am trying to get to use the current formatted maps for both APRS and for
the GPS companion. I only have GPS companion maps of the USA and I need to
sort some out for South Africa.

If any of the amateur cartographers amongst us can help I would be greatly
appreciated.

Many thanks for all you time in advance.

.PDB files are standard PalmOS database files. I believe they can
contain other types of objects. It's been a while since I read about
them.

Do some research into how to program for PalmOS, and you might be
able to figure out what is actually inside those particular .PDB
files. You might start with the GCC development stuff for the Palm,
as a lot of the documentation for that should be on the 'net. Once
you figure out what's hidden inside, you might have a better idea
how to manipulate the data.

Good luck,

"....works really well..." Almost! I don't have the D7 but my D700 works pretty much the same way ... however, the other day I went to answer someone on a two meter repeater (on the non-data side) and between the time I decided to push the mic button and the time I actually *did* it the D700 decided it was time to transmit on the DATA side. So that when I did "key down" the DATA side was transmitting. I answered the call, but when I unkeyed I heard the fellow say he didn't hear me and I must have left the freq.

Evidentally, I was transmitting voice on the 144.39 for that 'key-down' I would have thought that if the non-data channel is the PTT channel and the data channel decides to transmitt it would disable the mic button.

Not a big deal (now that I know about it) but I think it could have been done better.

As far as interupting the voice channel, not any more than if you had two seperate radios. The desense of the voice radio by the data radio would be hard (not impossible) to eliminate.

Mine took exactly a month to the day that I sent it to Kenwood West. It
took several phone calls and posting my experiences here to get it back in
that amount of time. Had I not been persistant, I may never have gotten
the radio back.

Document everything and send the radio insured/return receipt requested -
the person at Kenwood who signed for my radio made sure his signature was
completely illegible...thus insuring plausible deniability.

Not surprisingly, trying to use my TH-D7 inside my car doesn't work all
that well. I need advice on improving the situation. What I'm leaning
towards is a magnetic mount 2m/70cm mobile antenna that I can slap on the
roof and feed the cable through a door sill. Will that improve things?
Any other ideas?

Thanks,
Jim KD5LUQ

HI Jim, sure that will improve things, I use a window clip on device (coax
attached) and an sma to bnc adapter. Then you can pick a better rubber duck.
Find one that wont flop around to much in the wind.

Also a 12 V adapter will improve your power out, I use the Kenwood, I believe
it has a noise filter in it.

I use the MFJ micro mag mount, dual band antenna. Price is $19.00 or so and
you'll need an SMA to BNC converter for it. This makes it possible for me to
get into all the local repeaters quite readily (within ~20 miles). If you
want better coverage, go for th 5/8s wave antenna and I bet you'll get about
double that range.

Rendered body type: text/plain

So, I'm reading about the new space station and see the following:

Tentative operating frequencies are: Worldwide downlink for voice
and packet, 145.80 MHz: worldwide packet uplink, 145.99 MHz; Region
1 (Europe) voice uplink: 145.20 MHz; Region 2 and 3 voice uplink,
144.49 MHz.

Can my D-7(A) do these odd splits? I know, RTFM, but it's out in the
shack somewhere, right now. . . I can only get it to go in 50 kHz
increments by using the split function. Does this radio have another
way to set odd offsets? It seems like my older Kenwoods could,
(something like pressing one or two buttons and the ptt?) but I haven't
needed anything like that in a long time.

TIA

```

```
- APRS Survey 2000 Now Open -

First let me thank nearly 100 APRS folks that provided excellent feedback
for the APRS Survey 2000 web page. This project started 6 months with a
simple idea. I got input from Bob B, and other APRS movers and shakers. I
also got suggestions from amateurs on several APRS mailing lists. I hope
the results of our efforts show.

I feel the need to emphasize that this is not a popularity contest. It is
meant to foster communication between folks with similar equipment. I
provide it as a service in the hopes that some "good" may come from the
information. The survey is based on the honor system. To help prevent
skewing the results, the results will not be posted until the survey period
is over at the end November. However, you can see where the respondents
came from on a map of the US. An amateur radio callsign is required, but
you may remain anonymous if you wish.

APRS Survey 2000 http://w9if.net/cgi-bin/aprssurvey/main.pl

Getting a large number of respondents will aid in providing an accurate
cross-section of the APRS community. So thanks in advance to those that
complete the survey and spreading the word.

Rich Parry, W9IF

Rendered body type: text/plain
```

```
Problem:  Kenwood TH-D7A(G) will not talk to laptop running Kenwood software.

A friend (Bill, KG4JRP) received a TH-D7A(G) today so we down loaded
MD7G100.exe and installed it on his laptop.  When we attempted to program
memories and other features or read from or write to the radio we get an
error message something like "Invalid Radio"  We tried TNC off, TNC in APRS
mode and TNC in Packet mode.  No luck programing.

Software says it the version for G models and we selected USA/Canada
installation.

But radio talks to WinAPRS just fine with same cable / same laptop setup.  Of
course HT is in Packet mode.

Any suggestions to get the radio to respond to the programming software?

Thanks in advance.

DE W5KNB
Ken

Ken,

Make sure the radio is OFF and start the software. Then turn the radio on.

  I believe programming only works with the TNC off completely.

Ralph, KC2RLM

>Problem: Kenwood TH-D7A(G) will not talk to laptop running Kenwood software.

Rendered body type: text/plain

For those interested in pricing, I had occasion to order another G8 sensor box today. I'm getting it from www.navtechgps.com, their p/n 990286, cost $449.

For those interested in the ChargeGuard, I'm placing an order today for a few of them and some other stuff. You can see it at:

http://www.chargeguard.com/what_is_charge.html

and they will sell it to you for $74.95 plus shipping and possibly tax.

I can sell the ones I'm getting for $60 plus shipping. I'll make it easy and say $65 total in the US.

If you want one let me know by email. I had some interest in email from the 4Runner pics, I'll see if I can track those people down. The CGs are shipping today, so I'll have them by Tuesday or Wednesday next week.

To see the 4Runner installation again, http://www.tbo.net/4Tweb/4Runner.htm

73,

Chris KD6DSI

Hmm, I might have to try that. We have a couple of Wizards around here, not doing anything. I used to use one for packet, so getting it to work on the D7A would be nice. I'll have to round up the parts and cable and stuff and see what I can do.

Thanks for the idea.

Chris

Are you using the computer synch cable? Those are Null Modem configured. To use one for packet, pop another null modem adapter on the end, which will reverse it back to straight serial.
I had to do this with my rig. I have my D7 cable connecting to my GPS III through a Garmin factory auto power/serial harness, which ends in a serial connecter. One cable is null, one straight through serial, so I popped a Radio Shack Null adapter plug in between to get them to work. I think the D7 cable is the one that is straight through.

Rendered body type: text/plain

Makes sense. Took me ages to get a handle on this - so I'll share my 'serial cables with few syllables' thoughts...

RS232 is wired either as Transmitter or Reeciver. I think that is because
when they used ribbon cable, a flat cable would then connect a transmitter
to a receiver - they would connect them by crimping the plug onto the end
of the cable. You cant do that unless pin 2 at one end is TX and RX at the
other :)

Computers are transmitters and GPS/Modem and printers are receivers.

But mobile phones, palmtops and laplink cables are for connecting to other
computers (i.e. transmitter to transmitter) so need a NULL (cross over)
wiring. So they are transmitters that LOOK (at the end of the cable) like
receivers and hence plug into computers ok.

The GPS is a receiver so a straight through connects it to the PC

So PalmtopTX(+null cable) PLUS NULL adaptor PLUS straight cable -> GPSRX

In my car however I have:

GPS (receiver) + null modem cable + NULL modem adaptor + null modem cable +
Packet Radio Modem (receiver)

Clearly I could just use two straight cables and a null adaptor - but this way
the plugs that fit into the null modem adaptor are just right for
disconnecting and plugging either the GPS or Radio Modem straight into a PC...

(see why I had to think about it now.. :))

(shuts up)
Carl.

I don't know if this was mentioned previously or not......

Assuming I've understood your post and that the PG-4R cable is the PC cable to
the Kenwood D7....

I've found that some of the serial cables which are used to connect digital
cameras to the computers serial port may also be used on the D7.... in most
cases the plug end (to the Kenwood) is too large and I simply purchased an
adapter from RadioShack which converts the 3.5 mm plug to 2.5 mm size.

I only say this, as this might be an easier (cheaper?) alternative to buying the
PG-4R cable.

Cheers,
Tino, VE6SZR

I made my own cable, it is actually pretty simple.... All you need to do is buy a DB9 at Radio Shack and a 2.5MM 6' cable from Mouser. For under $10 you have a cable. I downloaded free software on the net to program memory channels and hyperterminal works fine for running regular packet. Pins 1, 4 and 6 get jumped together. Pins 7 and 8 get jumped together. Pin 2 is RXD, pin 3 is TXD and pin 5 is ground. RXD goes to Tip, TXD goes to ring, sleeve goes to ground.

22. [htaprs] MacAPRS thru the sound ports on a Mac LC/LC2?

From: Qrpvhf@aol.com
Date: Tue, 7 Nov 2000 14:55:01 EST
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-118592-2000.11.07-14.05.23--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Since I know it is possible to use the sound card as a TNC for WinAPRS, is it
possible or been tried to run MacAPRS thru the built-in Mac sound ports.

I have a LC and a LC2 with spkr and microphone ports so as to let sound in
and out.

I was figuring wiring would be basically the same as for Win interface.

Also seen the KISS TNC article in Nov.'00 QST and was wondering if MacAPRS
will do the same operations?

Not yet a user of MacAPRS as still resurrecting the Mac's and haven't got
them running yet. Hopefully this afternoon... after a local friend gives me
the PCfile reader extension.

Gentlemen

I am running APRSdata to send sat positions and
schedules out to my local area.
I loaded a set of new keps from AMSAT after a bit
of manual editing to get rid of mir and dead sats...

A friend with a D700 asked me if its possible to send
the UPlink and DOWNlink freqs along with the sat AOS
times? I believe there are spots for this data in the
OBJECT comments, but I must have fouled it up someway.

Is it supposed to send uplink/downlink info?

Old 68k Macs don't have nearly enough processing power to do this. It's
really time to retire these old beasts, folks.

MultiMode, which runs on PPC Macs, can transmit and receive 300 and 1200
baud packet through the sound ports. There's no interface to MacAPRS
yet. I've considered adding it, but haven't had sufficient interest
expressed in such a feature.

It is automatically included in every OBJECT. You cannot turn it off.
So its there for any D7 or D700 to see.

It is NOT in the "schedule" that shows up on the DX list, but it is
included in every satellite object when it is in view and transmnitted...

Rendered body type: text/plain

I keep a handwritten list of freqs, and modes.
I believe I have busted something in the software...

Here is a transcript of D-700 object as of 10 minutes ago.

```
FO29                    OBJECT
N67` 37.62'      2397MI( ^ )
W118` 15.38'   DP07UP  ( | ) 321`
CSE 336`  S999M     FROM:N3SDO-3
0    +0/0    0/R=04291 / MODE-
```

I assume where the zeros are is where the uplink/downlink
freq info is supposed to be.

Any suggestions on what I screwed up?

It is automatically included in every OBJECT. You cannot turn it off.
So its there for any D7 or D700 to see.

It is NOT in the "schedule" that shows up on the DX list, but it is
included in every satellite object when it is in view and transmnitted...

Rendered body type: text/plain

Hello Chris,

I have tested MultiMode several times and realized that it is constantly improving and incorporating new features. Since most of my "digital" activity is on APRS, I am not yet using it. Should it contain an

interface to MacAPRS, I would certainly go ahead and register it.

It is probably not worthwhile to add a lot of APRS features to MultiMode
itself. But maybe MultiMode could act as a soft TNC for the existing
MacAPRS and somehow "pipe" the data to other programs, analogous to
AGWPE. The port functions in MacAPRS should provide the necessary
interfacing structure via TCP/IP. This may then also work for other
programs to use MultiMode as an universal link between packet-radio and
TCP/IP (like browsers, terminal emulators and other stuff using TCP/IP).

If you have time to work on it, please consider this as a potentially
very useful feature for Multi-mode.

Best wishes

Hi Chris; I've tried MultiMode a few times on a 250 mhz Wallstreet
PowerBook but could never get it to decode anything properly in any mode.
I was really interested in PSK31 but the 1200 baud packet was an added
attraction. I gave up figuring it was the sound circuitry in the PB that
was at fault.

The ability to interface with MacAPRS would be a great addition, even if
I can't run it in my present configuration. I just added a 6115CD to my
collection, do you think MultiMode will run on that machine?

Right you are... my apologies for not communicating this to the list sooner.

The number of free "cycles" that I have to work on APRS/CE right now is more limited than I'd like, but I have been working on it. I'm planning on having another build out by the end of this week. I will probably make it good 'til March, since my time-between-builds is longer than I have been estimating.

Thanks, everyone, for your continued patience!

I recently upgraded my D7 with the E version firmware. When I unpacked the unit, it slipped out of my hands, bounced off my knee, and fell on the floor. The shaft for the control knob snapped off, leaving the unit unusable. It surprised me that the shaft broke. The radio fell only two feet, so beware that the control knob is fragile. The shaft is very thin brass, perhaps 1/10th inch in diameter. If the antenna had been attached, perhaps it would not have struck the knob when it fell, but it is still a potential problem. I saw another posting regarding the same damage to another D7. I would expect this repair to be very expensive.

I returned the unit to Kenwood for service. I explained that it was my clumsy hands that caused the problem, and offered to pay for the repair. They fixed the unit free of charge and returned it to me. This kind of service is above and beyond what I expected from them. When I get bad service, I am the first to complain, so it is only fair that I thank them for good service.

Thanks to Kenwood Service Center East

Rendered body type: text/plain

Hi there,

Just bought an emap from garmin and connected it to the d7...

Put the set in nmea but no position is showing up...
The pos stays at 00.00.00 but the decimals are blinking...

APRS stations hearing on the d7 are showing up in my
emap....

Is this a problem with the gps string from the emap.... I
have an European type D7 first model...

Does the d7a(g) works with the emap...?? would be a reason
to buy one....while i am down here...

73 from a sunny Florida..

the D7
> -Rob-
>

Put the emap in nmea
Switched the d7 on and off, cycled through the tnc

NO WAY   the decimals and degrees in my pos   are blinking
but the right pos doesnt show up...

but it does put the aprs stations on the emap as
waypoints.....

I think my version of the d7 does not understand the emap
nmea format....
maybe to much digits after the comma....I think the first A
serie had the same trouble....

Vicinity tracking works in APRSdos based on the RF path. So it is useless
after a posit traverses through the internet where the original RF path is
stripped off.

Best thing to do is to look at the map beforehand and jot down the
LAT/LONG of the 3 or 4 key points you may visit or pass through. Then you
can always estimate your actual position relative to one of these. It is
easy considering that a minute of LAT/LONG is about a mile within about
10% in the USA.

This is more than adequate when you have position ambiguity enabled anyway
so that your posit is only posted to the nearest mile anyway. Knowing the
LAT/LONG of my house, I think I can estimate my position just about
anywhere in the county to a few miles... close enough to let people know
where I am ...

Yup the both the US non-G and G upgrades work fine wih the eMap. Tried and
tested by me. The newer versions of eMap firmware also allow NMEA in, so
you can plot other people's position reports as waypoints.

Rendered body type: text/plain

Hello all,

I would like to throw out a question to see if I'm getting the same results
as others. I just purchased a Magellan Map 330. After connecting it to my
D7(G) I had no problem getting the 330 to feed the position to D7.

What didn't happen is that stations where not listed on 330 as waypoints.

Should they be or is this feature not supported by the Magellan Map 330?

Check the documentation that came with the unit to see if there is a setting for the MM330 for NMEA in and out. Also check the TH-D7(G) to make sure you have waypoints selected (on). If these are both correct, perhaps it is a problem with your wiring.

Im just about to put the TM D700 into the car. I have an ICOM 8way mic plug
to (telephone dial) 8 pin socket, needless to say the pins are not the
same as for the Kenwood - but I have identified the Ptt and gnd, and mic+ and
mic- so that's ok.

Except it isn't. The IC207H was happy with an ex-PC microphone, but the
D700 can't hear anything through it.   Do I need a tie clip electret with
a battery :(The ICOM never did. PTT works fine.

Meanwhile its still in the shack and Im deciding what PM settings to store.

What hands free mics are people using with the TMD700?

(This message is posted on the HTAPRS SIG on a monthly basis.)

PURPOSE

The purpose of the HTAPRS SIG is to provide a forum for folks interested in discussing the new, hot
technologies related to APRS (for example, the APRS-ready radios from Kenwood.)

POSTING MESSAGES

To post messages to the HTAPRS SIG, send email to htaprs@tapr.org

HTAPRS SIG RULES

The HTAPRS SIG has a few simple rules:

. Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

. Stick to the subject, i.e., hot technologies related to APRS. Subjects that are only tangentially related to hot technologies related to APRS (like "what kind of car should I buy for my new Kenwood transceiver?") may be considered off-topic. If you start a message with "this is off-topic..." then you are violating this rule.

. Be succinct when composing a message. (The HTAPRS SIG software has been optioned to limit the length of each message.)

. When quoting a previous message, only quote the parts of that message you are referencing. (The HTAPRS SIG software has been optioned to limit the length of a quote.)

. Do not send messages in HTML of Rich Text format.

. Do not send attachments.

. Cross-posting is not permitted. (The HTAPRS SIG software has been optioned to prevent cross-posting.)

. The HTAPRS SIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the HTAPRS SIG, follow the directions you will find at the bottom of each message you receive from the HTAPRS SIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the HTAPRS SIG, please email the HTAPRS SIG administrator at the address below.

Stan Horzepa, WA1LOU, wa1lou@tapr.org

G'Day All

My D-700 (and TM-251 before that) were connected to a cell-phone hands free microphone put on the strut between the windshield and the drivers window. I found an electret mic that was about 3/16" diameter and have that sticking under the plastic work just hanging about 1" out... This is about 6-9" from my mouth when I am talking. I then connected this to the radio with a bias resister to 8V.

PTT is more impressive. I drive a manual car. I went to my local Radio Shack/Tandy store and purchased a foot switch for a dictation machine. I wired this into the PTT line of the radio.

The whole setup works well - I can drive and talk at the same time - and I do not accidently press the PTT, except sometimes momentarily by accident...

John N8UR can confrirm that it works well... He heard me use it a few times over the last few days...

Rendered body type: text/plain

Hello All,

Kenwood recently upgraded my TH-D7A to the "G" version and I didn't have
much of a chance to check it out before I went on a trip to New York
City (I live in Seal Beach, CA).

While there, I got the lat/lon off my GPS and manually plugged in the
numbers to the TH-D7. After I confirmed several packets got out,
findu.com placed me at the south end of Central Park; south and east of
the GPS coordinates at 79th St. & Columbus. Hmm.....

After I got home, I plugged in the lat/lon of my home QTH as taken off
WinAPRS with PM3. Again, I came up on my home WinAPRS south and east of
my actual location roughly the same distance as in New York.

So what we have here appears to be the same symptom using lat/lon from
different sources on opposite ends of the country. The only common
factor is that I manually put in the numbers to my newly upgraded
TH-D7A(G). I know the TH-D7(G) uses a compressed data format...could
something in that be buggered up internally in the TH-D7A(G)?

Has anyone else had this or a similar problem? Suggestions?

Thanks de K6TVI - Rick

Do you have position ambiguity turned on?

Reports from my TH-D7A(G) show up in exactly the right spot on findu.com, so
I don't think it's a general problem with the TH-D7A(G).

About how far is it off? Is it in the neighborhood of 100 meters or
less? If so, it might be your choice of datum that you've selected
on the GPS itself. It should be set to WGS84 before you read off
the numbers and plug them into APRS equipment.

Most of my paper maps use NAD27 datum, so I'm constantly having to
switch my GPS back and forth.

Could it be an issue of your GPS reading out (and you entering)
degrees-minutes-seconds, and the D7A(G) expecting degrees-minutes-fractional
minutes? In the Northern Hemisphere and West of the Prime Meridian doing
just that would make your transmitted position read to the south and east of
your actual position. (Unless you happened to be at a position that had no
fractional number of minutes in both latitude and longitude -- pretty
unlikely!)

Hope this helps.

I forgot to mention how far it is off. It is around 1 mile. Also as I
said, I've used lat/lon from two different sources. One from GPS and one
from Precision Maps 3.0 with similar results.

A successful launch has brought P3D (the biggest amateur radio satellite ever) into orbit.

See
http://www.arianespace.com/status_mini.html

And
http://www.amsat.org

for more info.

It might be a long time before they finish all the necessary tests, but it should bring on a new era in
amateur satellite work!

Rendered body type: text/plain

I get occasional reports that the audio from my D700 is weak. I always hold the mic in front of my mouth, so it appears to be a problem with the radio. I hate to send it in for repair when the problem is intermittent. Has anyone else experienced similar problems? Is there a mic gain adjustment anywhere?

I had a similar intermittent audio problem on three Kenwood TM733s. Sometimes the mic audio was sufficient and sometimes mic audio was unreadable. I sent the radios to Kenwood west requesting they check audio in path. I told them no hurry just find the problem. It only took 5 weeks including shipping time and cost about $87 including shipping per radio. They had to replace at least one surface mount part in each and gave them all a tune up. Kenwood made them work great again.

The cause of my problem was I had plugged a MIC-E (with Kenwood personality header) into the RJ-45 microphone jack of those radios and used it that way for a few days. No immeadiate apparent damage but over time I received reports of the mic audio sometimes being weak.

There is a TAPR addendum to add a diode into the MIC-E if you are going to use it via an RJ45 mic connector of a newer Kenwood radio.

Probably not directly related to your mic audio problem but the techs at Kenwood west get my thumbs up for quality since my local bench techs couldn't isolate the intermittent mic audio problem.

btw- current time on the TH-D7(G) upgrade is just under 5 weeks.

Rich - NØRUL

I had been using my D7 until last week when the battery ran down, I put
it aside and then at the beginning of the week I popped it into the
charger and let it sit overnight. 14 hours later I took it out and it
wouldn't power up. Thinking the battery was shot I tried another battery
and same deal 14 hours later ... it powers up if I plug the charger into
the plug on the D7 but nothing happens unless power is coming in through
the plug .... seems somehow its not 'talking' to the battery ... anyone
seen anything like this?// Sigh, I guess its off to Kenwood East ...

The mic audio seems ok, but I dont use the supplied mic in the car so I cant
say it would all of the time. I wondered about the 8v feed to the electret I
have it isolated from the kenwoods audio gubbings with a 1mfd cap - I was
thinking of losing the cap to increase the gain but the mic-e report has made
me think again.

That is the first I've heard of. Sounds like your power adapter receptacle (on the radio) thinks there is a plug in it all the time. The radio will not accept power from the battery while a power adapter is plugged in. (This is a little different than some of their other radios). You could try fiddling with this yourself, or it sounds like maybe it is off to Kenwood.

Walter

I leave mine on all the time on my motorcycle on trips and have no
battery warming. It charges the same weather the radio is on or off.
If you run it thru a switched circuit the radio comes back on were you
left it. I wished my D-700 would do that.

Hi all,

     I'm trying to get access to the flash ROM chip in the Citadel using
Interlnk & Intersvr. I'm using a straight DB-9 <> DB-9 (with a gender
changer) between it and my Compaq 5300 using the com ports of each. I'm
getting a "No Connection Established" message on the Citadel ... and I'm
starting Intersvr first, then trying to get the Citadel to connect. Am
I missing something? Does anyone have a help file (or some such docu-
mentation) for these programs?   73

Related D7 question. I have a 10v supply to my THD which runs fom a cigarette lighter socket - which CHARGES the THD7! - I assume this only applies whilst it is switched off?? Or is the THD floatcharging its nicad when on external! <shudder>

I assume it would charge faster if I had the full 12v on it.

I had this problem once, just insert the adapter, wiggle it about and remove it. The problem was the battery disconnect switch in there got stuck, and it is too small to really work with. Just try this and I think it will work. I haven't had any trouble since.

Good Luck, 73

Hector KE6VRL

Hi, Arte. I think Interlnk and Intersrv are the predecessor programs for the

Windows Direct Cable Connection system. While Microsoft, with their
usual thoroughness does not tell you so, I'm pretty sure you need a
null modem cable instead of the straight through serial cable. The null
modem
crosses pins 2 and 3 in the cable. I just tried Direct Cable Connection
between
two of my computers using a Traveling Software (LapLink) blue serial cable
and it worked fine. The blue serial cable is a null modem cable.
Hope this helps. Good luck!

Rendered body type: text/plain

I'm wondering if Kenwood sells the bracket for the control head of the
D700.

I've mounted the D700 in my work vehicle and would like to be able to swap
it into my personal vehicle quickly and easily. Since the glue has set on
the head bracket, I would like to buy a second bracket for my personal
vehicle.

Any ideas?

Hi all,

     Okay. Null Modem, good. I got the two computers to recognize each
other ... sort of. Drive C in the laptop is drive F to the Citadel.

     But when I do a F:\ <cr> dir /p on the Citadel I'm seeing ASCII
jargon in place of the directories. One character for each directory
which, when I try to CD\ to that directory, am told it's an invalid one.
The Compaq is running Win98.2 with FAT32 ... which is what I think the
problem is. PC-DOS obviously is unaware of the existense of FAT32. Am
I correct in this assumption and (short of reconverting that drive to
FAT16) can you think of a way to transfer files from the Compaq to the
Citadel?   73

I had to go to my win 95 machine to get mine to work. Still dont know

what I am doing. But if worked. My 98 will not.
This . This pk-unzip-d has still got me confused. Why cant they have
explicit instructions. I need to know every key stroke to type in. and
why. My pen thing only has pk .9 my 98 does not have anything. except
win unzip. And I dont know what any of that crap means.

Don't know the answer, but does anyone remember what the computer said in
the movie Andromeda Strain? Maybe that's your answer.

rick, N6NR

p.s. just kidding.....you need to process another "delete" even though it
does not show any messages. I've had to do that with my D700 a few times.

Generally it requires one more push of the delete button. It is
definietly a glitch, I see it all the time. Sometimes it won't go away
and what you need is a another new message and then delete it and delet
again and it will go away ... I have not found out the particular
pathology of this is though so I am not sure what the circumstances are
that produce it.

I see this frequently, too. The only thing I can do to see it (without 100%
repeatability) is to delete a message off the "list" before I have actually
"read" it (viewed the complete message).

For me, the "false" indication of unread messages only goes away if I let
the message list fill up with 16 new unread messages, then read them all
completely, then delete them one by one.

B01 - Yes, mine does that too, I just ignore it.

BTW, has anybody been able to cross band 2m/440
and be able to remotely QSY the D700 via DTMF?

It claims to be able to do this in the book, but
I have only been able to do this when the rig is
not in cross band mode. (what good is this function?)

80. [htaprs] APRS Survey 2000 closes in 48 hours, Delaware and South Dakota wanted

From: Richard Parry <rparry@qualcomm.com>
Date: Tue, 28 Nov 2000 19:04:02 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-121988-2000.11.28-21.18.12--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There are 48 hours remaining in APRS 2000 Survey. I'll close the survey Nov
30 and make the results available this weekend. 861 folks responded! Thanks
to everyone for making the survey a success. I hope the survey database is
useful.

Still need South Dakota and Delaware for WAS. The demographics is shown on
map at:
http://w9if.net/cgi-bin/aprssurvey/voter_profile2k.pl

The survey is at:
http://w9if.net/cgi-bin/aprssurvey/main.pl

For those who missed the Nov 1, announcement, I repeat it below.

thanks,
Rich Parry W9IF
==========
APRS Survey 2000 Now Open
First let me thank nearly 100 APRS folks that provided excellent feedback
for the APRS Survey 2000 web page. This project started 6 months with a
simple idea. I got input from Bob B, and other APRS movers and shakers. I
also got suggestions from amateurs on several APRS mailing lists. I hope
the results of our efforts show.
I feel the need to emphasize that this is not a popularity contest. It is
meant to foster communication between folks with similar equipment. I
provide it as a service in the hopes that some "good" may come from the
information. The survey is based on the honor system. To help prevent
skewing the results, the results will not be posted until the survey period
is over at the end November. However, you can see where the respondents
came from on a map of the US. An amateur radio callsign is required, but
you may remain anonymous if you wish.

APRS Survey 2000 http://w9if.net/cgi-bin/aprssurvey/main.pl

Getting a large number of respondents will aid in providing an accurate
cross-section of the APRS community. So thanks in advance to those that
complete the survey and spreading the word.

Hi all,
I won the bidding on the D700 that Stan H. tested in the May 2000 QST. Am
interested in obtaining a GPS with removeable antenna (brand?) and a
computer (wife's laptop or a Palm or what else?) Space is limmited in the
2000 VW New Beetle so the Palm looks promising. Any recommendations would
be helpful.
Thanks
Allan Ingram, KE6QCA, La Mesa, CA

Alan,

I just got an Garmin GPSmap 162. It is great interfaced with the either my D700A or D7A(G). Stations are displayed on the GPS using the waypoint feature of the Kenwoods. Built-in maps are fine, but will load in maps from MapSource this weekend. Display is much larger than a Palm.

West Marine is offering the 162 for $360 if you sign up for their credit card.

Anyone know if any of the cheap GPS units can be configured to automatically power on when provided with external power?

I'm looking to semi-permamently mount a GPS unit in my car, and want to run power to it such that it's on when the car is, and it's off when the car is off (and unlikely to be moving. :-)) Since the D700 will keep it's last fix if it loses the GPS, I figure that should work fine....

Right now it looks like the cheapest units out there are the refurb Tripmate, Earthmates, and the eTrex.... The Earthmate is out because of the NMEA issue, and the Tripmate you need to short a pin out to get it to start NMEA. Looking at the online manual, I don't see a way of getting the eTrex to automatically power up.....

Anyone have any suggestions? I'd hoped to mount this in the back window ledge of my car, which makes manually powering it up difficult every time I start the car....

I can't think of anything inexpensive that would do this, but an OEM board
(plus power supply and antenna) or one of Garmin's TracPak units (a
board/antenna combo; feed it 10-30VDC and it spits out RS-232 NMEA) would
work. I've seen the TracPak's for $180.

Garmin GPS-35. No display, no buttons, nothing to go wrong.
Weatherproof enclosure (but look out for the supplied screws for
mounting 'cuz they corrode).

A clarification on my original post re the 162. I bought the 162, Garmin
P/N 010-00191-00, which uses a supplied external antenna. This antenna is a
marine style. It would function on a vehicle or at home but would require a
little work building an adapter(or use a marine mount). I had an old
Garmin mag mount antenna which interfaces fine with the 162. The antenna
connection on the GPS is BNC.

There is another 162 designated as the 162i, Garmin P/N 010-00192-00, which
has a built in antenna, these are about $342 using West's current deal.   I
do not know if the 162i will also interface with an external antenna.

The 162/162i 's accept waypoint names up to ten characters long so there is
no truncation of call signs and SSID's.

Robert: Why not just leave the GPS receiver on all the time?
I leave my Garmin GPS 48 on in the car all the time. It is
never turned off unless I don't plan to drive the car for four
or five days. The current drain is less than 100 ma, and I've
never had a problem with it running down the car battery.
With it on all the time, you would also save the start up
lock time that you will have if you turn it off every time
you park the car.

I also switch off the power to my GPS35; actually its controlled by the
ignition switch. For me personally, it has nothing to do with current drain.
I have it go on and off so that my tracker interval time changes
automatically. Startup time for a GPS35 that hasn't moved since it was
turned off is usually less then 30 seconds. However, I have seen it go as
long as 2 minutes. That occasion was when power had been removed for about
14 days.

In my KPC3+ I have the 1st buffer set to clear after transmission and the
2nd buffer set not to clear. Thereby I can have two different beacon rates;
one while moving and one while stationary. Here in SoCal where the aprs
scene is pretty saturated it becomes important to be a nice neighbor.

I also have the two buffers set to two different destination paths. That way
it shows as a truck while moving (GPSLK) and as an 'X' when stopped (GPSBO)

I use the Rand McNally Streetfinder GPS. I got mine for $70 and that
included the PC software. Without a laptop it is necessary to purchase the
cigarette lighter plug from Rand McNally for about $15. I have had mine for
six months now and have been quite happy with it.

The Rand McNally GPS unit will fit the bill. When it's connected to power
(nominal 5V DC from the PS/2 mouse port of a laptop but it'll happily run
of 12VDC) it's on; no power and it's off. You'll have to wait for it to
get a position lock, though.

There have been numerous posts to this board about modifying the PS/2
connector, pinouts, or just lopping it off and connecting the power,
ground, and data out lines to your tracker.

I leave my GPS on all the time but use a ignition switched
relay to interupt
the data to the TNC....
My notes are at
http://kg7il.foxinternet.net/ham/aprs/swdata.htm..
It exploits a KPC-3+ feature. Don't know if the D700 has a
similar feature.

got my truck its a chevy silverado 4x4 extended cab.

looked under the hood and the fuse block on the drivers side under the hood has two posts labled a and b and its labled aux power. looks to me like i just attach rings post lugs to it and fuse the line into the cab area.

anyone else done this on the chevy, or how did you wire yours?

its got two batteries under the hood main and aux and the isolator. so comeing off the aux.

Hello Jim,
You can have a look here " http://www.mindspring.com/~jc1/serial/main.html ". If you don't find what you
 want, let me know and i will look at home.

Where can you confirm this? Has there been a firmware upgrade for this
model? I downloaded the 162 PDF manual from Garmin, and all the screenshots
clearly show the standard 6 character waypoint. Please enlighten. Maybe a
screenshot from your specimen?

Thanks,

Jim N0RMO

Also, is it possible to grab screen shots
using Waypoint+ ??

On second thought, probably not, as the display dimensions are so much
larger.

Jim,

My 162 was delivered with software version 2.13 and manual P/N 190-00169-00
Rev. A.

Page 34 of that manual under the Enter/Mark key as a note to item 3 says :
"Note: You may use up to 10 alphanumeric characters for the name."

This is well hidden in the manual and refers to capturing your present
position as a waypoint. I agree all the examples shown are six characters
maximum.

I set my D700A to provide 9 character waypoints, the max. setting on the
Kenwood and the 162 displays 2X3 call signs with a two digit SSID without
truncation.

The Garmin site has updates available for the 162 units and I have since
updated to version 2.52 by download.   The ability to input waypoints into
the unit occurred only a version or two before the initial delivered
configuration of my unit but all versions can be updated to 2.52 from the
same download. The Garmin download site for the 162 spells out in fair
detail what is changed in each version.

73, George , N7HPE

This is a good idea. The las vegas QST machine (www.lvrac.org) provides 24
hour touchtone access to voice recorded audio messages on demand. find out
all about local repeaters and clubs, swaps , etc.

        On touchtone 9, its recorded aprs data that spits out local digi,
proto paths, and talkback infor for aprs. when a ham presses 9, a audio
voice instructs the ham to got to aprs mode and standby for a data dump.
then about 1 1/2 minutes of stored aprs info is xmitted.

     when the shuttle is up, the machine is used for retransmission of
the astronauts on demand.

      i always thought a qst machine at dayton would be great to give local
info on demand or continous about parking, meetings, times, etc etc etc etc.

   HEY, now thats a good idea automated info at dayton to answer all the
same questions. put it on 146.73 simplex, the QST on 73

Sounds Interesting... One question, how does one go about
capturing a 1.5 minute aprs data dump? Is it one big message,or
a series of smaller messages? How will this interact with a
D-700 running or a D-7 only using the factory displays?

22. [htaprs] D700 power lead control wierdness

From: "Chris Arndt" <carndt@slonet.org>
Date: Wed, 06 Dec 2000 06:28:02 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-123152-2000.12.06-08.40.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last weekend I rewired my truck D700, and installed an Ashtech G8 Sensor
Box in place of the Tripmate. I changed the power feed from an ignition
switch controlled relay to a ChargeGuard. The only change I made to the
D700 programming was to set DCD to both bands.

I've always left the radio powered on, on the control head . It used to be
that the radio would then remember that, and power up when the relay
applied power to the +12vdc wire.

Now for some reason, it has stopped doing that. When the ChargeGuard powers
up the radio, I have to turn it on manually with the control head switch.

The radio in my wife's 4Runner is wired the same way, and works fine.

I checked the APO setting in the radio, and it's OFF.

Any ideas?

Chris

Mine behaves the same way. For a period of time, the radio turns on when
the ignition is turned on. Then it doesn't do this for a while. There must
be a configuration setting to control this behavior, but I haven't been able
to find it. I think I know how to force it to the "must turn on by hand"
mode. Just turn the radio off by hand, then turn off the ignition key. I
don't know how to restore it to "auto on when power applied" mode. One
would think that leaving it on when the key is turned off would set this
mode, but it doesn't.

Anyone out there know how this is set?

Rich - KE1EV

24. [htaprs] APRS software with TH-D700A

From: "Jeff Ellis" <blue_ciaran@yahoo.com>
Date: Wed, 6 Dec 2000 09:46:38 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-123185-2000.12.06-11.58.48--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I want to get my Kenwood TH-D700A setup in my car for a Trip from Washington to Southern California for Christmas and have several questions:

1) Which APRS programs can pull the GPS data from the D700A? I only have one serial port on my laptop and would like to see on a map my position as I go.

2) What are the best setting for a trip like this? Relay,Wide-3? That is what I am currently using around my area.

3) Tapr.org's ftp sight does not seem to be working is there a mirror someplace? It starts a login and in the middle of the message about what to do if there is problems it loses control. I have tried the passive mode and that did not help. I have tried since yesterday afternoon with out luck. Its possible that maybe the firewall at work is having problems but I can ftp files from a lot of other places right now.

4) Any tips on putting this radio in my '99 Miata? I think the battery is in the trunk so I though about putting the radio there but hearing anything with out using remote speakers could be a problem as well as running Mic, Display, GPS, Data, and speaker cables through into the cabin. That's a lot of cables to make room for. I am not sure where I would put the speakers anyways..... Its sure a small car and I would like to put things in a safe secure way but would be able to remove the hardware with out damage to the car later..

Thanks for any advice!

Jeff Ellis

I keep a a few extra 9 pin null modem adapters and gender changes adapter
just for d700 and d7a use. (need them for Palm aprs too)

Jeff,

I own a 99 miata as well, and I can tell you this much: There is a big fat hole through to the trunk just under the carpeting on the wall behind the passenger seat.

As for the GPS -> D700A -> PC problem, I personally would just rig up a pig tail with the data line _from_ the GPS going to two different serial connectors.

My current configuration has a GPSIII+ velcroed to the dash just to the right and forward of the steering wheel, with the GPS cable routed to the left, down into the dash (tied away with zip-ties), under the driver's door's step runner, behind the drivers side seat to the rear of the center console (through the trunk opener slot) where the D7A hides out of sight. The antenna cable runs from the center console, behind the passenger seat, under the carpet on the package shelf, through that big conduit hole, into the trunk.

For the D700, you may want to consider locating the main unit under the passenger seat, and running the front panel cable under the center-console/dash unit to the stereo.   The display can be placed in front of the tape deck, or the passenger air bag switch. (Neither is very important, eh?)

If you drive top down, you will not be able to hear the D700A anyway. I've considered pulling my tape deck and putting a radio in that slot, using the audio port from the tape unit to feed audio from the radio to the amp head.   Can't tell you how to do it, though, as I haven't bought a mobile yet.

Jeff,

The recommended generic path when you get to Southern California proper
is WIDE2-2. In an effort to reduce channel congestion, the local digis
were configured to NOT respond to generic RELAY and WIDE aliases,
therefore a path beginning with RELAY will not get you into the local
network (unless a low level home station serving as a RELAY is used).

Robbie,

A change was made last spring to make the major digipeaters in the Los
Angeles and San Diego areas respond to WIDEn-N protocol ONLY. This was
done to reduce channel loading, which had almost reached the saturation
point.

It is still possible that you could get into the network through the use
of lower level digipeaters which still respond to RELAY and WIDE, but the
high level sights would not respond.

The best way to handle the situation, if possible, is to set up multiple
digipeating paths. Some paths could be set to use generic RELAY and WIDE
and some using WIDEn-N only.

I built a null modem adaptor (from hot glue!) and added a jack socket
to be able to feed my THD7 with GPS data (and vice versa) whilst still
feeding a TINY-2 with NMEA strings. It worked fine. No flow control on
GPS data.

There is even a picture...

Rendered body type: text/plain

I need help setting up an APRS system for Search and Rescue. I am looking
and getting the Kenwood TH-D7AG radio for each of our teams along with the
Garmin III + radio. I want to have the command center to be able to see
the position of all the teams on one screen in real time. I would like the
computer screen to be the 7.5 minute scale USGS topo maps. We currently
use a program called Topo!GPS USA. Can somebody tell me where I can get
help setting this up? What computer software will do this for us? I am a
HAM but I am not very up on all of the APRS technology.

Thanks,

Lance

You may want to ask that question on the Turnkey_APRS mailing list

as well. Several SAR-types are on there.

I'm trying to get our people set up with that capability, and am
pursuing Xastir on Linux. I have it working with USGS DRG topo
maps now, but it hasn't made it into a release of Xastir yet.

I tried using topo maps as image files under APRS+SA for our
mock search. It worked, but not perfectly. Old symbols
didn't get deleted so you had to periodically refresh the
thing. It's not like having native support for the map format
built-in.

There are others in my area trying to use WinAPRS for SAR.
I haven't tried that.

I have successively used WinAPRS 2.4.7, a Rand McNally GPS,
and my Kenwood TMD-700A without splitting cables and so
forth.. As I originally set up the gps and the 700A as a
tracker, I just added the laptop running the software, put
the program into tracking me, and in Pico mode, the software
tracks me being in the center of the screen automatically
being refreshed on PM 3.0 as if I were using PM alone, or
tracking someone, me! Works just super!!

ALthough most WIndows versions of APRS give much better map displays than
the original APRSdos, if by chance your organization uses
STREETS-ON-A-DISK which many county level organizations have used for
years, then there is an APRSdos version that works very well with that

full featured map display system..

LA area APRS informal get together at Chris & Pits

LOCATION:
    CHRIS & PITS (Stake & Prime Rib dinners with full Bar)
    601 N Euclid St.
    Anaheim, CA
    About 2 to 3 lights south of Ham Radio Outlet in Anaheim

DATE&TIME:
    Dec. 8th
    Show up early to socialize in the parking lot 7:30pm
    Dinner tables are reserved for 8:00pm
    Stay as long as you like.

BRING:
    Yourself
    Friends and people interested in APRS
    Any APRS related equipment you have to show and tell, sell, trade or give away
    Any equipment you need help setting up
    Money for your meal
    Working APRS stations a plus but not required!

As your host (Robert Syms KO6ZL) I will be bringing my Laptop with WinAPRS and a new Garmin GPS 162 for all to see. A demo for beginners can be shown and a simplified explanation of how it all works. This meeting is not a club or a political gathering just friendship and a good place to meet other APRS users behind the Icons. Please contact via E-Mail if you can make it. I need to get an approximate count.

Rendered body type: text/plain

And you thought I had disappeared...

I pretty much had disappeared... I am currently working on two full-time software development contracts, so my apologies if I'm not replying to your e-mails in a timely manner.

Also, my sincere apologies for getting behind in this latest build of APRS/CE. As always, you, my users, make this all worthwhile and I appreciate your patience and feedback.

Get build 943 at http://www.tapr.org/~aprsce/ .

This release adds a weather status page on the station info screen, wind speed and direction display, mobile course and speed display, _sound!_ for new messages, and a little indicator at the top to show new incoming messages. I'm sure there's a bunch of other little things as well, you'll see them as you start to use the program again.

APRS/CE is getting very close to becoming version 1.0. However, because of my schedule, I've set the expiration for this version to _next_ _December_. That's December _2001_!

A few of you had asked why I put expirations on my builds. My logic was that it was beta code and probably shouldn't be hanging around on people's

machines for long periods of time - that way I only have one version to support. When APRS/CE goes to 1.0 and beyond, the expiration "feature" will be removed, replaced with a feature that requires registration before it saves any of your settings. The registration fee will be nominal, similar to pocketAPRS.

Thanks again for your continued interest.

Please, everyone, give me some feedback on the install and the program itself.

I just installed the new version and found it to be smooth and no problems were experienced.   I would still appreciate some user documentation (i.e., specifically how to set up a Compaq PC Handheld C140 with a Kenwood TH-D7(G)).   Also how do I obtain maps that will work with the aforementioned equipment?

Thanks!

Ah working to live instead of the other way around eh? :) Fairynuff.

943 wouldnt come via http: as the server was busy (good sign or what?)
but the ftp version arrived safely.

I'd de-installed the previous one - this installation includes no maps? Is
that how it has always been..Id forgotten.

Installation to the Casiiopeia E-115 went sweet as a nut.

I need to get another TNC set up to try this out.

> A few of you had asked why I put expirations on my builds. My logic was

I understand this - getting support requests five years later for a broken
beta would be annoying.

> Please, everyone, give me some feedback on the install and the program
> itself.

It's ok (so far)

TWO TEENY gripes. (1) It puts APRSCE into my Start list - and I dont want it there - I should have to actively put it there I think, it should install itself to Start menu!Programs in my view.

(2) APRSCE grabs the serial port- would be nice if it turned OFF the 'automatically synchronise when serial cable is connected' and turned it on on exit (perhaps as a user selectable function) its a pain when I forget to switch it back on and close APRSCE before I synchronise the casio.   (I suppose folk using USB wont have this issue...)

cheers!

Carl

Can anyone tell me if they have experienced this before? My D7a wont tx in packet mode above 445. As a matter of fact, it wont rx packet above 445. either.

The rig in in packet mode connected to a computer running a terminal program. I've tried both 1k2 and 9k6 and nothing. 440. thru 444.999 is FB. The rig ptts with the button but not via the serial port above 445.. I am on band B (obviously)and that is set as the data mode.

Can someone try this with there d7a and prove me wrong?

Eric:

My 1st guess is check your offset. I bet you have a + offset set into your radio, and it won't let you transmit out of band.

73!

= GEMINIDS METEOR SHOWER REGISTRATION PAGE NOW OPEN =

Web Page registration is now available for those who will be participating
in the upcoming December Geminids Meteor Shower event. The purpose of
registering is to provide a real-time list of participants. This should
expedite communication and increase the chances of success. It should take
about 1 minute to complete. Click on the URL below and then click on REGISTER.

http://w9if.net/cgi-bin/beaconet/main.pl

I got interested in this facet of amateur radio after reading the article
by W2EV in the Nov 99 issue of QST. I quickly realized that my chances of
success could be increased if I knew who was participating so I knew where
to point the beam. It was out of this need that I developed this
registration page. I hope that you find it useful. For those interested in
more information, the Nov 1999 QST article by W2EV and the Nov 2000 issue
of QST (page 28 and 83) may be useful.

Rendered body type: text/plain

Without reading my manual .... I'll say that "locked-band" only repeats in
one direction (from VHF to UHF ...or... from UHF to VHF) that is pre-set by
the user.... while "cross-band" will repeat in *either* direction depending
on which band hears a signal (if it hears a VHF signal it will repeat it on

UHF ... if it hears a UHF signal it will repeat it on VHF)

The network is very variable in the UK but thigs are generally on the up.
Yestderday was a drive to Ashby and then to Sheffield. Mt ant is clearly part
of the problem because when two D700s did the same road he tracked and I
didnt.... however near Sheffield I was called on 70cm by M0 ?? Ive
forgotten..but its in the D700... who then talkmed be around a traffic hold
up :)

Meanwhile I received a ping from MB7USA whilst i was still in Sheffield...

That is aprs at its more impressive :)

I think we need to encourage APRS to be used with phone - the live bit makes
for a much more useful system. I try and monitor 433.5 or local 70cm fm rpt-
it was su20 I was called on :)

Hello,
I'm using a TM-D700e for 2 months now and I noticed that it often switch off itself when receiving frame
 while monitoring APRS qrg !!
Do some of you notice the same thing ?
73s vy qro

70cm fm rpt-
> it was su20 I was called on :)

Whilst I agree completely with Carl, there is a major problem with
the current APRS protocol, as seen in the UK.

Fixed stations are advised to repeat about once per hour and mobile
stations, depending on their speed, about once per minute.

If you are a fixed station that has been on for over an hour, you will
know who is on. But a mobile passing through, will have passed most

fixed stations before their signal is heard.

We need an update to the protocol to overcome this problem. I've
suggested this before in the UK ui-view eGroups list, but been
ridiculed.

That is not a problem with the protocol, but with its usage. APRS was
designed for a net cycle time of about 10 minutes for local ops. APRSdos
defaults to a 10 minute rate when operated locally. As the user extends
his QRM to other areas with additional HOPS, his time is increased by 10
minutes for each hop to a maximum of 30 minutes.

Similarly we receommend all wide area digipeaters to ID locally once every
10 minutes and less often the more hops in the path. These are to solve
the problem to which you refer. Locals should see EVERYONE ON THE AIR
IN THEIR LOCAL AREA at least once every 10 minutes. We fought to get this
into the spec.   In the USA there was a move to change things to 60
minuets but as you see, it totally defeats the purpose of a real-time
tactical comms system...
 >

Exactly. The standard is 10 minuets for direct or ONE hop packets, and
less further out.   It is a tradeoff. But 1 hour completely defeats the

purpose of APRS...

> We need an update to the protocol to overcome this problem. I've

Yes, those that do not see the big picture or only think of APRS as
routine 24 hour a day ham radio will fight to keep your beacon rates low.
Those that actually USE APRS for real-time events or situations must have
it higher. Good luck, youwill never please everyone...

Dale,
   You can select custom messages 0 thru 6 as a position comment. You can't
program them to contain different names. The custom position comments simply
expand the number of position comments available. The meaning of these is
undefined, but can be used to indicate whatever you desire.

Your position comment selection is encoded as a number. The D7 sends your
selection, location and other information encoded in Mic-E format. This format
compresses the information to reduce the amount of time required for
transmission.

The THD7, D700, etc radios will decode a Mic-E packet and display the status
you selected in your radio. However, some applications presently in use are
not properly decoding these packets. They are displayed as regular position
comments rather than custom.

HTH,
Bill KC9XG

Hi there

I have a GPS development kit which consists of an engine, antenna and an
RS232 interface. This unit was manufactured by Rockwell International.
The unit came complete with DOS based software for communication with the
engine and experimentation. I did have the unit up and running some years
ago but did not have a specific use for it then. I would now like to use it
for APRS purposes but I find that the 5.25 floppy is unreadable. I have
searched

the web for info and have found references to NAVCOR V but the pages are not
 available . I think this is because Rockwell have bailed out of the GPS
business.
Can any one help me with the comm.'s software so I can set the unit up for
the
 right protocol etc that I need to get it to work.

Many thanks

Peter Black

Over on the HT list, Bob and Alan were discussing the frequency of APRS
beacons by fixed and mobile stations .. in response to Carl's suggestion
about advertising a voice contact frequency.

I've taken the liberty of duplicating that discussion on the main APRS
list, since it's not a "new technology" subject and I think many APRS users
would benefit or could add to the discussion. I think it's a good one. So,
I would suggest that further discussion take place on the main APRS list,
instead of the HT list. I hope that's OK, Alan, Carl and Bob. Your
original comments are quoted (mostly) below.

To summarize, Alan was lamenting that fixed stations only beacon every 60
minutes or so, and that means mobiles traveling through were apt to miss a
fixed station's beacon. Bob was sympathizing, saying that beacons less than
every 10 minutes ran counter to the idea of APRS being a real time tactical
network (Alan and Bob, correct me if that's a poor summary).

A few thoughts to add:

1. In the US, most fixed stations are not "live" -- there's no one at the
controls -- so I'm not sure why a mobile would be so keen to know the fixed
station's position. That's not saying there aren't good reasons, but I'd be
curious to hear why a mobile station would want to know about a passive (as
opposed to active) station.

2. Perhaps a (partial) solution for Alan is to make use of the ?APRS?
inquiry feature in the APRS protocol to trigger reports from other APRS
stations. (I'm not sure if the D7 and D700's have this built in -- either
to send it or to respond to it.) Of course, not all APRS stations will
automatically respond to this inquiry, for example, any stations running
without compliant software or with running without a computer and just a
TNC that doesn't respond to ?APRS?.

3. But as Bob suggested, if you are an "active" fixed station, then perhaps
it would be a very good idea to change your beaconing rate. If your station
normally beacons every 60 minutes while you're NOT at the controls, change
it to every 10 minutes when you are at the controls.

4. Come to think of it -- that might be a good software feature -- a toggle
for active vs passive mode. In passive mode your station would automatically:

* reduce the frequency of beaconing rates from every 10 minutes to every 30
or 60

* change to a passive status message, i.e. "unmanned station" vs an active
message something like "Active and listening on xxx.xxx Mhz"

* put APRS messaging into auto-answer mode "Sorry no one here right now.
I'll respond shortly"

* other?

And toggling to active mode would reverse those and initiate an immediate

POSIT and STATUS beacon.

4. I also like Carl's suggestion of advertising your voice frequency. I and many others put that in our status messages.

5. Of course that leads to the next problem -- a convenient voice frequency for mobile APRS users. Usually it's less convenient for the mobile station to switch to the fixed station's frequency. It's probably better for the fixed station to QSY to the mobile's voice frequency. But what frequency would be a good mobile frequency. In the US, it seems like that might be 146.52 (or 446.000), the common "calling frequency" -- even though that's simplex. Conversely -- to get the advantage of the local area repeaters -- a mobile might have to do a lot of button pushing to QSY. I guess I don't know what the best answer to all that is. Any suggestions?

73,

Ralph, KC2RLM

Bob responded to Alan who was commenting on Carl's:

The TH-D7G responds to the ?APRS? query. I wonder if making one of the
selectable status messages ?APRS? will cause other stations to respond with
their location?

>3. But as Bob suggested, if you are an "active" fixed station, then

Because it looks silly that with all my gear in the car which is
supposed to tell me what where is, I still have to ask someone for
directions if I try to find a fellow ham's house, or try to find the
EOC, or a shelter, or a fire station, etc., if I miss that one beacon.
:) Unless I'm willing to wait an hour and hope to catch the next beacon.

But seriously, if one would beacon only once an hour, then I might as
well use an overlay file instead of hoping to catch all beacons from
fixed stations. Another reasaon for a more frequent beaconing rate than
once an hour is that if one would miss one beacon, it means you will not
hear from that station for 2 hours. I have Xastir set up to grey out
stations after 90 minutes and it drops stations after 3 hours. This way
I get a reasonable (as in workable) picture of which stations are really

on the air.

Incidently, this also allows me to see propagation conditions which I
see as an added bonus of APRS.

> 3. But as Bob suggested, if you are an "active" fixed station, then perhaps
> it would be a very good idea to change your beaconing rate. If your station

I'm not sure how usefull and reliable that would be. If I want to know
if someone is at the controls, I send a "you there?" message. A beacon
rate of 10 minutes only tells me that the station is beaconing 6 times
an hour. The person might have left and forgot to set the beacon rate
back to an hour, perhaps it's a new station and thinks that a 10 minute
beacon rate is appropiate at all times.....

> I'll respond shortly"

I think that the status message and the auto answer message, as you
suggested, are sufficient and very appriopiate to indicate whether or
not you're at the controls.

>
> * other?

Change the icon, perhaps?

One very nifty feature of the KPC3 is the capability to do
four different broadcasts each with their own path and timing.
It would be nice if base station software had the same feature.

For example:

1. Beacon path "", every 10 minutes, "Hi you hear wa7nwp-17 direct"
2. Path "relay", every 20 minutes, ...standard Posit packet
3. path "relay,wide3-3" every 30 minutes "Hello world, wa7nwp@aprs."

(beacons 2 and 3 could alternate.. Timings are just ballpark.)

4th beacon could be used for something else..

Just an idea...

Bill

And it'd be so easy with a KISS (or Baycom or soundcard) TNC.

Yep, I wanted all APRS versions to make these things variable which was
the original design. APRS was designed to decay new info from high
rates down to low rates. APRSdos for example takes anything new and sends
it again 8 second later, then 16, then 32, then 1 minute then 2 minutes
and so on. THus in a message QSO, APRSdos can really fly when the first
packet is lost. Other than APRSdos, only APRS-PLUS has implemented this
process correctly I believe...

Some other programs only retry once a minute which drastically affects
throughput in real-time situations. These programs make APRS feel like a
non-real-time system. But dialog qso's between APRSdos stations
(and/or APRS-PLUS) can usually fly as fast as you can type...

APRSdos and APRS-PLUS also include ACKS built-in to outgoing messages,
again doubling throughput in a dialog... I posted this to the
other authors, but I dont think any implemented it...

I do not know about the details of all the other programs anymore, so I
can no longer have a feel for how they actually operate.

Again, APRSdos has always had this. You can assign as many paths as you
want and a probability to each one. Thus you can send 30% of your packets
direct, 30% via one hop, 20% via 2 hops, 10% via 3 hops, and 10% via 4 or
more hops. Its kind of kludgy, since it is statistical, but it was the
best we could do at the time.

Since APRSdos automatically sets the beacon rate to 10 minutes if the path
is onlyh to one hop or less, then this technique more or less accomplishes
the variable rate versus distance that not only provides more beacons
locally, but minimizes QRM further away...

The APRSdos varied paths are neat - but it isn't quiet the
same. The KPC-3 has different messages and beacon times
for the different paths.

Does APRSdos do this "randomly" or does it set up a sequence that
would follow the percentage?

Its random. Each time a packet is to be transmitted, the dice are thrown
and the paths are selected according to the *percentage" assigned to each
alternate path...

More of less does the job in a 24/7 routine operations. But in a
rapid-fire qso, I disable it... or actually, it is automaticaly disabled,
since APRSdos lets you assign a PATH to each message line...

I dont claim it is the best algorithm, but it was cheap (ie, took up few
lines of code which APRSdos is 100% out of...) grin

Actually, this isnt true. When ODA is activated in APRSdos, every
transmission causes the ODA
routine to change the path in the tnc (its based on percentage of time).
The message section, faithfully changes the path to /XX as attached to the
message(the first time a one line message is sent), but then doesnt know
that ODA changes the path. Hence, it believes the path is correct, but in
fact ODA subverted the actual /XX two lettered path. I've totally quit
using ODA, because when you send a message along a directed non aliased
path, the chances are that your specific two lettered /XX path wont be
used. I've complained about this (april 1999), but its not been fixed in
the last 18 months. Try it. Set up a few paths, and then send a message via
one of the other paths you've set up. Then watch the activity as you send a
message. You will be amazed to see you message going entirely different
paths other than what you specified.

Not unless you fixed ODA. I have reported that APRSdos sometimes misses a
lick and doesnt get the path actually put into path. I used to run ODA ,
until I found that there wasnt "any" path in the tnc at all. ALso using ODA
gives odd results, especially when you try to be efficient and use /XX two
letter paths. See the information I reposted below.

This happens at home and at work, with different tncs and different computers.

Here is a replay from April 1999 between Byron WA6YLB and Bob Bruninga
about the problems with ODA.

-0-

On Tue, 13 Apr 1999, Byron Smith wrote:
Is there any way that you could cause it to "suspend" doing ODA when a
person is doing messages? Otherwise, You have to go turn off ODA, do your
messages, only to return to declaring the ODA paths again.

Messages should always use the designated /XX path. That overrides the
alternate path process...

  I say this, as I like to use very specific paths for messages (shortest,
  best route - no aliases). For instance, if I want to send a few lines to a
  "local" I set the unproto path, or use a two lettered path.
  For practicallty, I usually always just set the U path (O U)

  Then I send my messages. I'd use the two lettered path if it was so that I
  am lazy and
  hate to have to keep adding the /XX to each callsign. Its easier to just
  set the U path
  and keep sending messages. (thats how I found the bug awhile back that
  ACK'd the wrong message out of order...)

Once you add the /XX you do not need to keep adding it to each new line to
that call...

  U mentioned the 5 second wait. ODA only changes to another set path. it
  doesnt revert to the orginal U path when you send a message. Even if you
  send a message to a specific path, the message will go out the desired two
  letter path the first time. The next message retry, ODA changes the path,
  and the message follows this new ODA path.

Are you sure? Not supposed to work that way...

  At 10:59 PM 4/13/99 -0400, you wrote:
It is complex but you are right. Is frustrating if you have to wait for
it every time it changes paths (5 sec delay). But if you are sending
bulletins, or positions or status or objects and you want them to cover
your 4 routes, then it has to be enabled all the time...

bob
On Mon, 12 Apr
1999, Byron Smith wrote:

It always uses the UNPROTO that you set, and then X% of the time it will
randomly use the alternates...

I dunno Bob. I dont see the orginal Unproto path *ever* come back. I've
gotten very frustrated using ODA, even though its probably the best way to
send beacons (specified paths vs W,W,W stuff) oes, is, that it changes
paths based upon the fact that APRSdos did transmit.

Try it. Enable a few ODA paths. Then send a few querys or womething that
makes aprs transmit. See the paths changing almost every transmission?

It appears to base its amount of time on the fact that an unattended aprs
station timers take 10 or more minutes to timeout before sending something.
When you start manually sending stuff, these timers are not watched, but
just the fact that aprs transmitted. Try it. emable ODA, then send a couple
messages. See how long it takes before ODA takes over.

If I have ODA enabled, and I send a message to a two lettered path, the
orginal message goes out
the two lettered path. then ODA takes over, and the message then goes the
ODA selected route.
The messaging part doesnt know the path was changed.

One of the things ODA needs, is, that if it detects any human intervention
at the keyboard, it ceases any path changes for like for 20-30 minutes.
Then ODA can resume.

Byron noted that Messages sent via /XX are also randomly affected by the
OPS-DIGI-ALTERNATE function:

Thanks!
I am so glad to see this documented.
Actually, I never use the ODA paths anymore either. THey were necessary
back before we had Callsign substituting digis and WIDEn-N's as the only
way to allow paths longer than 2 hops.. Now that the network will allow a

W,W,T,T path in all directions routinely, I have not tended to worry about
the ODA capability.

But now that I see that ODA has value as a "variable" rate mechanism,
maybe I should re-visit this...?

have those of you with the magellan meridian xl gps noticed that it
radiates rf and desenses the thd-7 receiver on 144.39?

        this means that when i go walking with the thd7 and the gps in the
backpack, i am unable to get my packet back or receive any aprs. if i
seperate the two units by 10 feet it clears up.

   plan on putting the magellan in the truck because its a battery eater
portable. going to get something else for portable gps.

not sure what to get thats small has nema out and has long battery life

Hi Steve,
I just got the Garmin eTrex and used it a couple of times with my D7a. Seems
to work great. Battery life is about 15 hours on two AA batteries and can be
plugged in to the car cig outlet. I picked one up for $119.

Does any one know if their is a place to get the flat four pin connector so
I can make a power and data combo cable?

73 and Merry Christmas to all!

I bought three. Nice plugs. I put one on the factory D7A cable, which is
nice, compact, and lightweight. I was trying to make a power/data cable out
of another, but that project is on hold, indefinitely :-)

74. [htaprs] Citadel Flash ROMs

From: Arte Booten <n2zrc@webspan.net>
Date: Sun, 24 Dec 2000 19:41:45 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-126154-2000.12.24-19.43.49--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

     I'm the proud owner of a 486 Citadel without a harddrive. It seems
to have a 2 Mb Flash ROM. I understand there are also 3 Mb ROMs availa-
ble for them. My problem is that I need to upgrade the APRS version and
set it up with more maps. The smallest that I can get the APRS.ZIP file
is too big to get into the 2 Mb ROM ... but would just barely work using
a one that's 3 Mb (including DOS, the touchscreen utility, interlnk and
pkunzip, of course)!

     This would, of course, be superfluous if we were ever to get driv-
ers for PCMCIA services. I'd rather like to use an Iomega CLIK drive on
it. Hmm, has anyone tried using a ZIP drive with the Citadel? Signifi-
cantly larger (and much more power-hungry), but may be viable by putting
a zip of GUEST.EXE in flash, editing AUTOEXEC to reflect this and using
that D:\ path to store and call as large an APRSDos as would fit on your
100 or 250 Mb Zip drive.   73

75. [htaprs] New TH-D7A(G)

From: Zachary Michael <kb9uqq_2000@yahoo.com>

Rendered body type: text/plain

Hi Gang,
I just got a new TH-D7A(G) for Christmas. I need to know, is it
possible to hook a Delorme Tripmate up to it? I remember seeing
somewhere that it will work in Packet mode, but not in APRS mode.
Maybe I'm wrong. I looked everywhere, but I can't find anything about
this. Also, can somebody give me the correct pinout for the cable to
hook up a GPS? The book tells you nothing about how to do this.

Zip drives work fine off the parallel port, use GUEST and you can slim
down the driver files to just the one that is needed, PP1 or PP2, The
real trick is to put a second 8MB of RAM in and build a 14MB RAM disk,
then unzip the contents of your APRS into the RAMdisk, then the Zip
drive doesn't need to run except maybe to copy log files or whatever.

Good Morning, I have heard that the ZIP Drive has been used with these
units. But also, you can add a hard drive. A simple IDE controller and drive
will fit in the case. I wrapped my drive with bubble wrap and taped it
inside. At the end of the ISA slot there are solder pads for the drive
power.

Scott

Subject: [htaprs] Citadel Flash ROMs

Hi all,

I'm the proud owner of a 486 Citadel without a harddrive. It seems
to have a 2 Mb Flash ROM. I understand there are also 3 Mb ROMs availa-
ble for them. My problem is that I need to upgrade the APRS version and
set it up with more maps. The smallest that I can get the APRS.ZIP file
is too big to get into the 2 Mb ROM ... but would just barely work using
a one that's 3 Mb (including DOS, the touchscreen utility, interlnk and
pkunzip, of course)!

This would, of course, be superfluous if we were ever to get driv-
ers for PCMCIA services. I'd rather like to use an Iomega CLIK drive on
it. Hmm, has anyone tried using a ZIP drive with the Citadel? Signifi-
cantly larger (and much more power-hungry), but may be viable by putting
a zip of GUEST.EXE in flash, editing AUTOEXEC to reflect this and using
that D:\ path to store and call as large an APRSDos as would fit on your
100 or 250 Mb Zip drive. 73

Here are your answers. This is the setup that I use on the D700 as well as the D7.

1st modify your tripmate. You do not have to do the power portion of the following mod (I didn't) but the rewiring you must do or it won't work.

http://www.qsl.net/kd4rdb/tripmate.htm

Then make-up a cable to female gender. Yes I know that the tripmate is a female as well but you can use this cable as a computer interface to the radio. Get a male to male 9 pin adapter.

http://216.133.235.165/SOFTWARE/THD7AG/thd7wiring.jpg

On the tripmate I put a powerjack on it and use a CD player power supply to get the GPS up and running. With both the radio transmitting at 50 W once every 30 mins and the GPS on for 2 days the battery in my truck never even notices it.

Hope this works for you

Rendered body type: text/plain

If I took the standard Garmin GPS to PC cable and combined it with the
TH-D7A(G) to Garmin GPS cable (one Garmin GPS connector, one DB-9
connector and one 2.5mm connector) would I be able to switch the 2.5mm
plug from the GPS hole to the PC hole on the HT and download info from
my pc to both the GPS and the TH-D7A(G)?

80. [htaprs] APRS Beacon trouble with THD7A

From: Jack Chomley <chomley@telelink.com.au>
Date: Wed, 27 Dec 2000 12:22:33 +1000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-126369-2000.12.26-20.33.25--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Listers,

I have setup my THD7A to send out an APRS beacon every 5mins,
but it will not work, I have tried other intervals, but no go.
I have set the beacon interval, set to auto, callsign and position
are entered too, unprotocol is default setting etc. All set up according
to my manual.
When I set the radio TNC to APRS and press BCON, it fires out the
beacon, after that.....it remains silent for evermore....unless
I switch BCON off, then turn it on, again it sends only 1 beacon.
I have fully reset the radio and reloaded the parameters....same
deal again, no change :-(
Any clues?? I have run out :-)

Hi listers,

Update time......
The news is not good :-(I wired the GPS up, set GPS to NMEA, set
the Garmin interface to NMEA V2 (4800 baud) and the GPS happily
sent its data to the THD7A, hit the POS button and yep.....what
was on the GPS.......was on the THD7A screen, checked TNC DCD
settings....tried each one, TX inhibit was not on, tried changing
BEACON intervals again.....still no go :-(I have the appropriate
DATA band selected, TNC on (not in packet mode) Checked that OFFSET
was not on. Strange thing is.......it works only when I press
the BCON button.......fires a BEACON once.......and that's it, until
I switch it off, then back on again.
No difference with GPS connected and running, to when its off and
not connected.
Now.......I am really lost!!

Is the radio set for GPS and no GPS is connected? My observations have been that unless the GPS is active no beacons. Is the beacon icon on?

83. [htaprs] Re: APRS Beacon trouble with THD7A...NOW FIXED!!!!

From: Jack Chomley <chomley@telelink.com.au>
Date: Wed, 27 Dec 2000 19:43:49 +1000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-126403-2000.12.27-04.00.27--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Listers,

Thanks for all the ideas! The fix is.......turn OFF the battery saver
mode! I had it set to .6 of a second. The moment I switched it OFF
it worked......with NO GPS plugged in. I can only assume it is sending
the position coords that I have manually set, along with the STATUS
text. Even with my GPS plugged in and BAT SAVE on, it would not work.
So, it seems the battery saver must be OFF when APRS beaconing is
desired.
Again.....thanks for the help! I have spent nearly all day on this :-)

84. [htaprs] Help with TH-D7A(G) and Delorme Tripmate

From: Zachary Michael <kb9uqq_2000@yahoo.com>
Date: Wed, 27 Dec 2000 08:58:51 -0800 (PST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-126446-2000.12.27-11.11.01--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Gang,
Now that I know that the Tripmate will work, and I have made the cable to hook it up to the TH-D7A(G), can somebody please help me get it configured? I made the cable to hook the Tripmate up to the D7, and I made a cable that allowed the Tripmate to self-start and still run on batteries. Then last night when I plugged it in, all it did was beep at me. Can somebody help me get this all worked out? When I plug it in all it does is go "du" then after about ten seconds it does it again. I have no idea what this means, and it doesn't explain it in the manual. I also know that if it were working correctly, when I push the Position button it should have the fields filled in with my latitude and longitude, but it doesn't. I have my settings set correctly, I think...
GPS UNIT NMEA
WAYPOINT OFF (since I don't have a unit with a display)
LOCATION EVERY 60
GPSTEXT $GPRMC (that's all that the Tripmate outputs)
GPSBAUD 4800
I emailed a friend last night and he told me to reverse the pins on the connector going to the D7,

but I told him that the pinout should have been right since I got it off the internet. Maybe that is my problem. I got it from this website: http://kg7il.foxinternet.net/ham/aprs/d7pintouts.htm. I thought that it said that is was the right pinout. I know that the manual reverses them, thats why I went on the internet. If somebody can help me I would really, really be greatful!
Thanks,
Zachary Michael, KB9UQQ

85. [htaprs] Re: APRS Beacon trouble with THD7A...NOW FIXED!!!!

From: "Walter Dunckel" <walter@radiohound.com>
Date: Wed, 27 Dec 2000 09:20:14 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-126455-2000.12.27-11.31.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I use the battery save mode all the time on my TH-D7A and TH-D7A(G)'s and they work fine beaconing in auto mode. Battery saver turns off the receiver and only turns it on every .6 seconds (or whatever you have set it at) to see if there is a signal on the frequency. If there is no signal, the receiver is turned off again for the increment you have set. This should have no effect on your beacon rate, at least is does not on my two D7's. I suspect the problem was something else, or the radio was momentarily confused.

If you have a G model, it will block the transmission of your beacon if you have it set to GPS and have no valid data from the GPS port of the radio. It sounds like this was not the case because you have manually entered your coordinates, so it should be set to NO GPS. The pre-upgrade D7A model has no such feature and will send out a 00 00 00 coordinate when no GPS is connected with GPS selected.

Rendered body type: text/plain

Hi Listers,

I have a Tiny 2 TNC (1 RS232 Port) with V5 EPROM, which has an APRS command set. Does anyone have a list of suggested operating parameters for this TNC.....I want to use it as a tracker

TNC......I have yet to get a GPS engine......any suggestions?
In the meantime I will test it with my Garmin 38.

It works fine in GPS mode - ... the fancy digipeating is a plus - and being
able to alter the settings remotely by connecting from the shack (or a
palmtop and THD7!) is neat too.

I set mine to 4800 baud so I didnt have to keep altering the GPS settings
when pluggin it into the PC.

See http://you.genie.co.uk/carl.littlejohns/aprs.htm

These are my settings, most are default but I don't really want to sort
through and chop out the distracting ones :)   If you have further questions
however...

DIGI 7 is the best one to use of all the new options. You will find
most exisiting software tries and send DIGI ON which generates an error
message (little bit of non-backward compatibility there) MON ON fails too,
MON 1 just shows you unconnected packets! Neat! MON 3 is equivalent to MON
ON was.

89. [htaprs] Any func. diff 'tween a stock D7A(G) & a D7A->(G)?

From: JD Erskine VA7JD <VA7JD@rac.ca>
Date: Sat, 30 Dec 2000 21:40:03 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-127275-2000.12.30-23.52.23--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi folks,

I've been following the list since the spring and am about ready to get a
D7A(G), unless Icom comes out with something tomorrow, more likely at
Dayton I guess. The question is, is there _any_ difference, significant or
otherwise between a unit sold from the store as a D7A(G) and one I can get
for a pretty good price that is purportedly about one year old, was a D7A
and had the factory upgrade to a G? Haven't had a really functional HT for
a few years now, since '93 which is quite depressing so don't want to blow
it now. I'd really like to play with SUNSAT and all the other fun stuff
you've been doing recently.

Thanks for your time es 73, JD VA7JD

There is no difference from an upgraded G model to a G at the store except
that you would not have to pay tax, and the unit may have a few scratches
pre-applied for you. They both use the same Eprom that controls the
microprocessor, so they both function the same. There are no hardware
differences.

Walter

so does mine (it is a THD7 E Firmware trial nr. 2)
The unit has some bugs, but this one I never saw here.

Rendered body type: text/plain

Hi all,

     Okay, I got several replies about using zip drives (and a possibi-
lity about PCMCIA functionality), but the original problem was:

>It [has] a 2 Mb Flash ROM ... there are also 3 Mb ROMs available ...
>The smallest I can get APRS.ZIP is too big to get into the 2 Mb ROM ...

>but would using one that's 3 Mb ...

Looking back on it, this may have been worded poorly. I wanted information about finding and installing that 3 Mb chip. 73

For immediate release 19 December 2000

SCCA ProRally Championship Announces
New Event for 2001 Season - Round #2 Cherokee Trails

DENVER, CO: The second round of the 2001 season will be an all-new addition to the Sports Car Club of America's ProRally Championship. Headquartered in Chattanooga, Tennessee, the International Cherokee Trails Rally will include three days of intense competition in the Cherokee National Forest. With a 3-day format and nearly 180 stage miles in the route book, the event is

under
consideration by the FIA for full international status.

When & Where:
15-17 March; Chattanooga TN; approx. 95 miles northwest of Atlanta, GA.

SCCA Event Rank:
Cherokee Trails is a full points SCCA ProRally Championship event. Drivers
earn points towards the national championship, and supporting manufacturers
(Hyundai, Subaru, Mazda and Mitsubishi) earn points towards overall and
class
Manufacturers Championships.

Historical Background:
The Cherokee Trails Rally marks the return of SCCA Performance Rally to the
Southeastern US after a five-year hiatus. Run in 2000 as an SCCA ClubRally,
the event earned high marks from entrants, spectators and industry
observers,
and earned its national status for 2001. For the first time in the United
States since 1987, this performance rally will be run under FIA rules, which
will include reconnaissance (recce) and pace-noting. Vehicle class structure
will follow FIA conventions, in tandem with the nationally recognized SCCA
classifications

ProRally Championship Contact:
Kurt Spitzner - SCCA ProRally Championship Marketing and Media Manager
Pre-event:B 303.779.6622 (country Code: 1)
Email:werace4u@aol.com

Cherokee Trails ProRally Contact:
John Shirley - Clerk of the Course
Kendall Russell - Rally Manager/Organizer
Pre-event: 865.671.1133
direct inquiry Email: krrally@cs.com
Time zone at event: EasternTime (GMT -5 hours)

Event website accessible through the sccaprorally.org website listed above

About the SCCA ProRally Championship:
SCCA Performance Rally, comprised of the national SCCA ProRally
Championship,
the regional SCCA ClubRally Championship, and local SCCA RallyCross events,
starts its 28th consecutive season on January 26-27, with the aptly named
Sno*Drift ProRally in northern Michigan.

Performance Rally is a globally recognized sport, with millions of fans
worldwide. The sport is a unique test of endurance for both the participant
and the machine, and thrives in environments where traditional racing
activity never treads. Typical SCCA ProRally events will feature fields of
40 - 80 production-based automobiles, and cover hundreds of miles over a
12-24 hour period, with much of the competition under the cloak of darkness.

94. [htaprs] Running APRSdos with a D700

From: Byron Smith <wa6ylb@theworks.com>
Date: Sun, 31 Dec 2000 12:49:40 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-127359-2000.12.31-15.04.46--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am looking to find others that have run APRSdos with a D700 in TNC mode.
I have done this, but find that the program will lockup the tnc in the
D700. I have seen the D700 send out hundreds of "flags" data. I usually

have to turn off the D700 and turn it back on to clear this constant transmit.

I have also run Winaprs on the D700 in tnc mode with no lockups.

Byron Smith

96. [htaprs] TH-D7A Upgrade

From: "Herb Gerhardt, KB7UVC" <gerhardt@hctc.com>
Date: Sun, 31 Dec 2000 19:18:36 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-127418-2000.12.31-21.29.00--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Am debating whether to upgrade my TH-D7A to the G model?

Is it worth the $60?

I have two D7A's and my wife has never used any functions other than using
it as a plain 2 m radio. Of course the two models program differently, so,
if I upgrade, I have to upgrade both of them.

I am happy with the way the D7A operates and am not sure I want to spend the
money to upgrade them.

If you upgraded yours, please give me your thoughts on the value of this
upgrade.

Thanks,

Herb, KB7UVC
